Title of Each Class	Trading Symbol(s)	Name of Each Exchange on Which Registered
COMMON STOCK, \$0.001 PAR VALUE	INO	Nasdaq Global Select Market

SECURITIES REGISTERED PURSUANT TO SECTION 12(G) OF THE ACT: NONE

Indicate by check mark if the registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act. Yes No

Indicate by check mark if the registrant is not required to file reports pursuant to Section 13 or Section 15(d) of the Act. Yes No

Indicate by check mark whether the registrant (1) has filed all reports required to be filed by Section 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding 12 months (or for such shorter period that the Registrant was required to file such reports), and (2) has been subject to such filing requirements for the past 90 days. Yes No

Indicate by check mark whether the registrant has submitted electronically every Interactive Data File required to be submitted pursuant to Rule 405 of Regulation S-T during the preceding 12 months (or for such shorter period that the registrant was required to submit such files). Yes No

Indicate by check mark whether the registrant is a large accelerated filer, an accelerated filer, a non-accelerated filer, a smaller reporting company, or emerging growth company. See definitions of "large accelerated filer," "accelerated filer," "smaller reporting company," and "emerging growth company" in Rule 12b-2 of the Exchange Act. (Check one):

Large accelerated filer	<input type="checkbox"/>	Accelerated filer	<input checked="" type="checkbox"/>
Non-accelerated filer	<input type="checkbox"/>	Smaller reporting company	<input type="checkbox"/>
		Emerging growth company	<input type="checkbox"/>

If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act.

Indicate by check mark whether the registrant is a shell company (as defined in Rule 12b-2 of the Act). Yes No

The aggregate market value of the voting and non-voting common equity (which consists solely of shares of Common Stock) held by non-affiliates of the Registrant as of June 28, 2019 was approximately \$279,656,181 based on \$2.94, the closing price on that date of the Registrant's Common Stock on the Nasdaq Global Select Market.

The number of shares outstanding of the Registrant's Common Stock, \$0.001 par value, was 145,803,086 as of March 11, 2020.

DOCUMENTS INCORPORATED BY REFERENCE

Portions of the registrant's definitive proxy statement to be filed with the Commission pursuant to Regulation 14A in connection with the registrant's 2020 Annual Meeting of Stockholders (the "Proxy Statement") are incorporated by reference into Part III of this Report. Such Proxy Statement will be filed with the Commission not later than 120 days after the conclusion of the registrant's fiscal year ended December 31, 2019.

PART I

ITEM 1. BUSINESS

This Annual Report on Form 10-K (including the following section regarding Management's Discussion and Analysis of Financial Condition and Results of Operations), or this Annual Report, contains forward-looking statements regarding our business, financial condition, results of operations and prospects. Words such as "expects," "anticipates," "intends," "plans," "believes," "seeks," "estimates" and similar expressions or variations of such words are intended to identify forward-looking statements, but are not the exclusive means of identifying forward-looking statements in this Annual Report. Additionally, statements concerning future matters, including statements regarding our business, our financial position, the research and development of our products and other statements regarding matters that are not historical are forward-looking statements.

Although forward-looking statements in this Annual Report reflect the good faith judgment of our management, such statements can only be based on facts and factors currently known by us. Consequently, forward-looking statements are inherently subject to risks and uncertainties and actual results and outcomes may differ materially from the results and outcomes discussed in or anticipated by the forward-looking statements. Factors that could cause or contribute to such differences in results and outcomes include without limitation those discussed under the heading "Risk Factors" below, as well as those discussed elsewhere in this Annual Report. Readers are urged not to place undue reliance on these forward-looking statements, which speak only as of the date of this Annual Report. We undertake no obligation to revise or update any forward-looking statements in order to reflect any event or circumstance that may arise after the date of this Annual Report. Readers are urged to carefully review and consider the various disclosures made in this Annual Report, which attempt to advise interested parties of the risks and factors that may affect our business, financial condition, results of operations and prospects.

This Annual Report includes trademarks and registered trademarks of Inovio Pharmaceuticals, Inc. Products or service names of other companies mentioned in this Annual Report may be trademarks or registered trademarks of their respective owners. References herein to "we," "our," "us," "Inovio" or the "Company" refer to Inovio Pharmaceuticals, Inc. and its subsidiaries. References herein to "DNA medicine" refers to Inovio's product candidates for cancer and infectious diseases in development.

Organization and Description of Business

Inovio is a biotechnology company focused on rapidly bringing to market precisely designed DNA medicines to treat, cure, and protect people from diseases associated with human papillomavirus (HPV), cancer, and infectious diseases. Our DNA medicine pipeline is comprised of three types of product candidates, DNA vaccines, DNA immunotherapies and DNA encoded monoclonal antibodies (dMABs). In clinical trials, we have demonstrated that DNA medicine can be delivered directly into cells in the body through our proprietary smart device to consistently activate robust and fully functional T cell and antibody responses against targeted cancers and pathogens.

Our novel DNA medicine candidates are made using our proprietary SynCon[®] technology that creates optimized plasmids, which are circular strands of DNA that can produce antigens independently inside a cell to help the person's immune system recognize and destroy cancerous or virally infected cells.

Our hand-held CELLECTRA[®] smart delivery devices provide optimized uptake of our DNA medicines within the cell, overcoming a key limitation of other DNA-based technology approaches.

Human data to date have shown a favorable safety profile of our DNA medicines delivered directly into cells in the body using the CELLECTRA[®] smart device in more than 6,000 administrations across more than 2,000 patients.

Corporate Strategy

Our corporate strategy is to advance, protect, and once approved, commercialize our novel DNA medicines to meet urgent and emerging global health needs. We continue to advance and clinically validate an array of DNA medicine candidates that target HPV-related diseases, cancer, and infectious diseases. We aim to advance these candidates through commercialization and continue to leverage third-party resources through collaborations and partnerships, including product license agreements.

Our partners and collaborators include ApolloBio Corp., AstraZeneca PLC or AstraZeneca, Beijing Advaccine Biotechnology Co., The Bill & Melinda Gates Foundation, Coalition for Epidemic Preparedness Innovations (CEPI), Defense Advanced Research Projects Agency (DARPA), GeneOne Life Science, HIV Vaccines Trial Network, the U.S. Defense Threat Reduction Agency's Medical CBRN Defense Consortium (MCDC), National Cancer Institute, National Institutes of Health, National Institute of Allergy and Infectious Diseases, Plumline Life Sciences, Regeneron Pharmaceuticals, Roche/Genentech, the University of Pennsylvania, the Walter Reed Army Institute of Research, and The Wistar Institute.

We or our collaborators are currently conducting or planning clinical studies of our DNA medicines for HPV-associated precancers, including cervical, vulvar, and anal dysplasia; HPV-associated cancers, including head & neck, cervical, anal, penile, vulvar, and vaginal; other HPV-associated diseases, such as recurrent respiratory papillomatosis (RRP); glioblastoma multiforme (GBM); prostate cancer; Human Immunodeficiency Virus (HIV); Ebola; Middle East Respiratory Syndrome (MERS); Lassa fever; Zika virus; and COVID-19 (coronavirus).

Our Differentiated DNA Medicines Platform

Overview of our platform

We believe that stimulating the immune system specifically to treat or prevent cancers and infections is a compelling concept. We also believe the opportunity for immune-activating DNA medicines has become especially promising in the wake of recent technology advancements, such as checkpoint inhibitors, which have had a significant impact on the way certain cancers are treated. Still, despite promising results in clinical trials and drug approvals in limited indications, there remains a critical need and opportunity for further advancements.

Our DNA medicines platform is comprised of precisely designed DNA plasmids -- circular strings of DNA that contain an optimized genetic sequence of an antigen or monoclonal antibody specific to a targeted disease to be produced independently inside a cell. The proprietary design and optimization process of our DNA plasmids is called SynCon[®]. These plasmids are delivered directly into cells in the body by our proprietary CELLECTRA[®] smart devices, which apply transient electrical energy to facilitate significant cellular uptake of the plasmids. Once inside the cell, the plasmids enhance the ability of the body's intracellular machinery to temporarily produce the target antigen or monoclonal antibody. We believe that together, these technologies may have versatile capabilities both in terms of myriad disease targets as well as product opportunities.

The characteristics and core components of our DNA medicines platform include:

1. SynCon[®] Design Process: Our SynCon[®] optimized plasmids have shown the ability to help break the immune system's tolerance of cancerous cells and facilitate cross-strain protection against unmatched and matched pathogens.

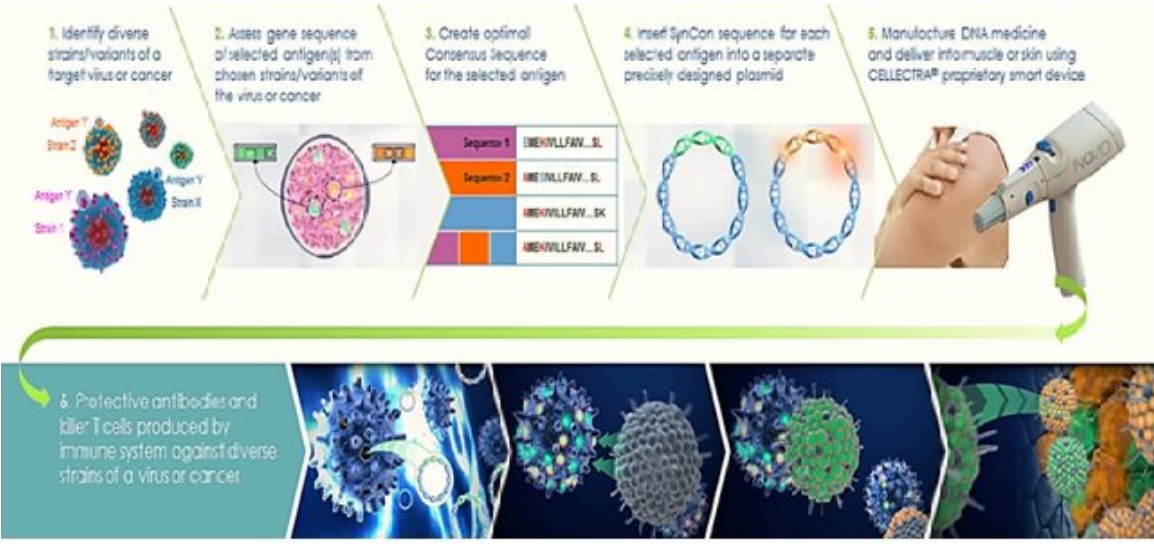

2. CELLECTRA[®] Smart Device: Our DNA medicines are injected directly into the cells of the body using our hand-held CELLECTRA[®] smart devices. Our application allows the patient's body to facilitate cellular uptake of the plasmids, which then enhances the ability of the intracellular machinery to temporarily produce the target antigen or monoclonal antibody. Our CELLECTRA[®] smart devices facilitate optimized cellular uptake of our DNA medicines, overcoming a key limitation of DNA-based immunotherapies. An antigen produced in this manner induces the immune system to generate polyclonal antibodies or T cells with the ability to perform their preventive or therapeutic functions. Similarly, DNA-encoded monoclonal antibodies, or dMAbs[™] generated in this manner can also trigger desired immune system functions.

3. Our DNA medicines have generated best-in-class in vivo immune responses: With our core platform technologies, we have developed a pipeline of clinical-stage product candidates that have generated best-in-class in vivo immune responses, in particular CD8+ T cells that are fundamental in eliminating cancerous or infected cells.

4. Our DNA medicines work more naturally with the immune system: Our DNA medicines are non-live and non-replicating, and therefore do not cause the underlying disease. Compared to other technologies, our DNA medicines are designed to work more naturally with the immune system and within its controls to reduce or minimize the risk of unwanted inflammatory responses.

Our mechanism of action for our DNA medicines process is shown in the figures below.

SynCon[®] involves the proprietary design and optimization of our DNA based plasmids, which are delivered directly into cells in the body by our proprietary CELLECTRA[®] smart devices.

DNA Medicine Platform in Detail: Delivery Science

The goal of our DNA medicines platform is to generate and deliver safe and effective therapeutics and vaccines. Our technology allows us to enable in vivo generation of functional immune responses to achieve desired therapeutic and preventive outcomes. Historically, we have focused primarily on in vivo production of disease-specific antigens directly in the body to stimulate prophylactic or therapeutic immune responses. More recently, we have explored an additional new application for the platform: in vivo generation of monoclonal antibodies to achieve preventive and therapeutic outcomes complementary to our antigen-generating immunotherapies.

With these core technologies, we have developed a robust pipeline of over 10 clinical-stage product candidates that have generated robust in vivo immune responses, in particular responses of CD8+ T cells, which have been observed to be fundamental in eliminating cancerous or infected cells. Clinical results to date have shown a favorable safety profile of our DNA medicines in more than 6,000 administrations across more than 2,000 patients to date.

There are two components to our DNA medicines platform. The first is our biological component, known as the SynCon[®] immunotherapy platform, where we encode antigens into close-circular DNA plasmids. These DNA plasmids are highly optimized antigens or transgene proteins that have been optimized to drive increased expression intracellularly while also driving immune responses. All of our DNA plasmids are facilitated by our proprietary CELLECTRA[®] smart devices technology which is the second component of our platform.

SynCon[®] DNA Medicines

Our SynCon[®] DNA medicines are designed to treat an existing disease (therapeutic) or prevent a disease (prophylactic) by activating and magnifying an immune response to one or more disease-specific antigens (proteins associated with a cancer or infectious disease that the body will recognize as foreign or not normal). Our DNA medicine candidates are able to direct the patient's immune system to fight specific organisms or cells in a highly targeted and robust fashion, without the potential cost and quality control and manufacturing challenges of medicines involving *ex vivo* processes, such as T cells with chimeric antigen receptors, or CAR-Ts. We do this by introducing the specific genetic code for a target antigen into the cells of the body that will serve as a temporary antigen production facility.

Our DNA medicines consist of one or more DNA plasmids encoding one or more selected antigens. Our proprietary smart devices enables significant uptake of the DNA plasmids by cells in localized tissue, which is typically muscle in the arm, to cause a therapeutic response and for the skin to induce a protective response, as described below.

After the DNA code for the targeted antigen(s) is introduced into cells, the cells' natural machinery for producing proteins temporarily produce the selected antigen(s) encoded by the DNA sequences. The antigenic proteins manufactured through this process are then presented to the immune system and trigger one or both of two arms of the immune system:

- the production of preventive antibodies, through a process known as a humoral immune response; and/or
- the activation of therapeutic CD8+ T cells, through a process known as a cellular or cell-mediated immune response.

These responses then neutralize or eliminate infectious agents, such as viruses, bacteria, and other microorganisms, or abnormal cells, such as malignant tumor or infected cells. T cells can be immediately "trafficked" to parts of the body where cells are displaying the target antigen. Memory cells are also created for durable effects.

Our SynCon[®] DNA medicines are designed to generate antigen-specific antibody and T cell responses. First, we identify one or more antigens that we believe are the best targets, based on extensive due diligence, pre-clinical and clinical data that we have evaluated to direct the immune system toward a particular cancer or infectious disease. We then apply our SynCon[®] precision design process, which uses the genetic make-up of the selected antigens from multiple variants of a cancer or strains of a virus.

For each antigen we create a new genetic sequence that represents a consensus of the slightly different DNA from multiple variants or strains of the targeted antigen. We can create a differentiated SynCon[®] variant to help the immune system better recognize a cancer self-antigen (a cell and antigen grown in the body) and "break the tolerance" of cancer cells in the body. In human clinical trials, we have generated immune responses with SynCon[®] DNA medicines that were not matched to different strains of an infectious disease, such as influenza or HIV, indicating that such immunotherapies may have more universal protective capabilities against unmatched strains of a circulating virus. As a result, these SynCon[®] constructs may provide a solution to broadly cover the genetic "shift" and "drift" that is typical of many infectious diseases. This new engineered sequence is similar to the originating sequences but does not match any, so we believe it is patentable.

The SynCon® sequence is inserted into a circular DNA plasmid with its own promoter. The plasmid is optimized at the DNA level for codon usage, improved stability of messenger RNA, or mRNA, and provided with enhanced and proprietary leader sequences for ribosome loading; it is optimized at the genetic level to enable high expression in human cells. We believe these design capabilities allow us to better target appropriate immune system mechanisms and produce a higher level of the coded antigen to enhance the overall ability of the immunotherapy to induce the desired immune response.

The plasmids are then manufactured in a bacterial fermentation process using scalable technology. These manufactured DNA medicines can be stable under normal environmental conditions for extended periods of time.

Our DNA medicine product development platform also allows for rapid design, pre-clinical testing, manufacturing, and clinical development of our DNA vaccine and DNA immunotherapy product candidates. Speed is an important feature, particularly as it relates to developing a response to globally emerging infectious diseases. Responses to emerging infectious diseases that we have been involved in are described in more detail below.

CELLECTRA® Delivery Technology

Our DNA medicines are delivered directly into cells of the body in a small local area of tissue using our proprietary CELLECTRA® smart device. CELLECTRA® uses controlled, locally applied millisecond electric pulses to create temporary and reversible permeability, or pores, in the cell membrane, all of which we believe is necessary for the effective delivery of nucleic acids into the cell. Through this process, the cellular uptake of the DNA plasmids increases by more than 1,000 fold compared to the injection of a DNA plasmid alone without other delivery mechanisms. This improved cellular uptake has enabled the immune responses that we have observed in our clinical trials along with the efficacy results generated by these immune responses.

Alternative delivery approaches based on the use of viruses, bacteria, nanoparticles and lipids are complex and expensive and have generated safety concerns. Because the vector itself possesses many additional antigens specific to the vector, it can attract unwanted immune responses that are believed to compromise the vectors' ability to deliver their DNA "payload" and provide protection. In contrast, DNA plasmid vectors possess no antigens of its own; the plasmid results in production of only the target antigen.

We have published preclinical data in which we observed improved immune responses generated by our SynCon® DNA medicines delivered using CELLECTRA® compared to a leading viral vector-based approach (Adenovirus type 5). We are not aware of any published data indicating the capability of alternative technologies focused on using genetic code to generate preventive or therapeutic antigens to exceed our immune response data obtained to date, nor to match the efficacy and immune response data generated in our controlled Phase 2b study of our product candidate VGX-3100, described below, based on *in vivo* production of such immune responses.

The delivery of our synthetic DNA medicines using our CELLECTRA® smart devices to date has shown a favorable safety profile in clinical trials, without serious adverse events and only transient mild local injection-related side effects such as redness and swelling. Our delivery is designed to be tolerable without the need for an anesthetic, and because it does not induce unwanted immune responses, it can be repeatedly administered for booster vaccinations.

We believe our CELLECTRA® smart devices provide a straightforward, cost-effective method for delivering our DNA medicines into cells with high efficiency, minimal complications and the ability to enable what we believe to be clinically relevant levels of gene expression, immune responses, and efficacy.

Choice of Tissue for DNA Medicine Delivery

Skeletal muscle has been a core focus for delivery of DNA medicines via CELLECTRA® because it is mainly composed of large elongated cells that are non-dividing, meaning that longer-term expression can be obtained without integration of the gene of interest into the genome. We have generated pre-clinical and clinical evidence that muscle cells may have a capacity for secretion of proteins into the blood stream. Secreted therapeutic proteins may therefore act systemically and produce therapeutic effects in distant tissues of the body. In this respect, the muscle functions as a factory for the production of the biopharmaceutical needed by the body. We envision that delivery of DNA medicines by CELLECTRA® to muscle cells will circumvent the costly and complicated production procedures of viral gene delivery vectors, bacterial gene delivery vectors, protein-based drugs, conventional vaccines and monoclonal antibodies. This approach may provide long-term stable expression of a therapeutic protein or monoclonal antibody at a sustained level.

In addition to generating pre-clinical and clinical evidence that intramuscular DNA delivery can be effective for a number of immunotherapies, we are also exploring delivery to the skin as a relevant route of administration for DNA vaccines. Skin or intradermal administration is important and is becoming an attractive site for immunization given its high density of antigen presenting cells (APCs). Unlike muscle, skin is the first line of defense against most pathogens and is therefore rich in immune cells and molecules. Skin specifically contains certain cells that are known to help in generating a robust immune response. With intradermal delivery, we may be able to demonstrate a comparable immune

response to muscle delivery. DNA medicine delivery into skin, or dermal tissue, is attractive given that the skin is the largest, most accessible, and most easily monitored organ of the human body, and it is highly immuno-competent, meaning that it is able to recognize antigens and mount an immune response to them.

Our CELLECTRA® Smart Delivery Systems

There are several configurations in the CELLECTRA® smart device family. The first configuration covers intramuscular (IM) delivery of DNA medicines; the second covers intradermal/subcutaneous delivery (ID) of DNA medicines. Smart devices with these configurations have been validated, manufactured under Current Good Manufacturing Practices (cGMP) and are being used in human clinical trials. We have filed device master files (MAF) with the U.S. Food and Drug Administration (FDA) covering the use of the CELLECTRA® smart devices in human clinical trials. These devices are intended to be used in combination with our DNA medicines.

Our CELLECTRA®-SP smart devices combine the functionality of our current generation of skin and intramuscular devices in clinical testing with enhanced form, design and portability. All components of the pulse generator and applicator are integrated into a cordless, rechargeable device. The rechargeable battery can enable immunization of several hundred subjects, making the device useful for mass vaccinations. The devices are designed to accommodate different electrode arrays to meet the requirements of the particular DNA medicine and targeted tissue for delivery.

Next-Generation Smart Device Development

We are also advancing a new generation of ID delivery devices called CELLECTRA®-3P. Currently used ID devices penetrate no more than 3 mm into the target tissue, compared to IM devices that go deeper. All of our current vaccine clinical studies are using these CELLECTRA®-3P smart devices.

We have been researching other avenues for needle-free, contactless technology for DNA medicine delivery. With the advancement of these devices our aim is to make DNA delivery amenable to mass prophylactic vaccination by decreasing dose levels, increasing tolerability of the vaccination, increasing the breadth of viable immunotherapy targets, and enhancing portability. Based on our data from preclinical studies of influenza, HIV, malaria, and smallpox antigens, we believe that DNA delivery with this newer generation of ID delivery, including surface electroportation (SEP) devices, has the potential to yield levels of immunogenicity in terms of both antibody and T cell responses and/or efficacy against a virus challenge that are comparable to IM delivery devices currently in clinical development.

In March 2016, we acquired needle-free jet injection technology, devices and intellectual property from Bioject Medical Technologies Inc. We are developing an integrated non-invasive delivery device combining Bioject's jet injection technology with our needle-free SEP technology. Bioject's needle-free devices, which use high pressure gas or springs to propel liquid medicine into skin, have been observed to have desirable utility, safety and tolerability attributes in preclinical studies and clinical trials. Under a prior research agreement, we had assessed the combination of Bioject technology with our new delivery system and generated compelling antigen expression and immune responses in animal studies.

In June 2019, we announced that the medical arm of the U.S. Defense Threat Reduction Agency (DTRA) will fund the further development of our new commercial ID delivery device. DTRA will provide \$8.14 million of grant funding to support us in developing a small, portable, battery-powered ID device to be branded as CELLECTRA® -3PSP, which will be used in the administration of our vaccines and therapies, including DTRA-developed products. In addition to the development of CELLECTRA® -3PSP, this award will fund the investigation of DNA vaccines developed by the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID) using the new device.

Our DNA Medicines Development

Our primary focus is to advance and potentially commercialize our DNA medicine product candidates developed from our optimized plasmid design and delivery integrated technology platform. Using this platform, we are currently developing a number of DNA medicines for the prevention or treatment of HPV-associated diseases, cancer and infectious diseases. The table below summarizes the status of our product development programs.

mechanisms to prevent excessive or incorrectly directed immune responses. Many cancer cells have the ability to “hijack” these checkpoints and neutralize T cells sent by the immune system to eliminate them. Checkpoint inhibitors prevent cancer cells’ ability to interfere with these checkpoints and enable T cells (especially CD8+ killer T cells) to complete their appropriate and intended killing function against cancer cells. Clinical trials of checkpoint inhibitors have shown notable therapeutic impact against melanoma and other cancers, but with response rates in the 15-20% range (and only in the case of melanoma going up to the 40% range or higher), there remains a significant opportunity. Observations suggest CIs may be less effective if there is not a high enough pre-existing level of antigen-specific CD8+ T cells in the tumor micro-environment, meaning that the tumor is “cold” rather than “hot” (with a significant level of CD8+ T cells). More recently, scientists have recognized that a strong CD8+ T cell generating “active” immunotherapy may be able to transform a “cold” tumor into a “hot” tumor and in combination with CIs may possess significant therapeutic potential to fight cancers.

More recently, a new category of immunotherapies called adoptive cell transfer, for example CAR-T technology, has provided further evidence of the merit of providing an enhanced T cell presence to fight cancer. CAR-T therapies have achieved dramatic results in B cell cancers. Unfortunately, they have also been associated with significant side effects. When this technology has been applied to solid tumors, it has generated significant cytokine storms that have resulted in severe side effects, including deaths. Moreover, adoptive cell transfer such as CAR-T, like dendritic cell therapy, involves removing T cells from a patient, modifying them to better target a cancer cell, multiplying the T cells, then returning them to the patient. These complex therapeutic products need to be manufactured and released for each patient, leading to expensive manufacturing and increased supply chain complexity.

Even though there have been promising technology advancements in recent years that better harness or activate capable killer T cells, we believe there is still significant untapped potential to develop “ideal” immunotherapies to fight cancers and infectious diseases.

What is an “ideal” active immunotherapy? We seek to advance product candidates that are effective, efficient and safe, specifically those that:

- target disease-specific antigens or proteins unique to a cancer or infectious disease;
- do not depend on complex manufacturing processes such as removal of dendritic cells or T cells from the patient that are then modified in the laboratory, amplified and then re-introduced in the patient as autologous or allogeneic cell based therapies;
- activate functional killer T cells with the necessary killing tools, such as granzyme and perforin;
- generate robust T cell responses or a significant number of T cells that are persistent and durable over time (memory response);
- do not induce unwanted immune responses;
- do not induce toxic inflammatory responses; and
- are capable of “breaking tolerance” of cancer cells grown in the body.

Data from our Phase 2b data of VGX-3100, discussed below, show that our product candidates are capable of achieving these characteristics with our approach to activating significant antigen-targeted T cells. Based on this approach, we are advancing a growing pipeline of pre-clinical and clinical immunotherapy product candidates.

Our Platform Progress to Date

VGX-3100 for the Treatment of HPV-related Precancerous Lesions

Overview and Background

Human papillomavirus, or HPV, is a sexually-transmitted, persistent infection with one or more high-risk (HR) genotypes of that virus can lead to, and thus are the causative agents responsible for, cervical pre-cancers (cervical dysplasia), cervical cancer, other anogenital cancers, and head & neck cancer, which is one of the most rapidly growing cancers in men. Scientific literature estimates that, at any given time, approximately 43% of the U.S. and world’s adult population is infected with HPV, and about 25% of adult men and 20% of adult women in the U.S. have a genital infection with one or more HR-HPV genotypes. The lifetime risk for acquiring an HPV infection of any genotype is about 70% in sexually active U.S. adults and about 80% worldwide.

HPV is the most common viral infection of the reproductive tract and is the major cause of cervical cancers. Almost 300 million women globally are estimated to be infected with HPV, with another 30 million additional cases that have progressed to the pre-cancerous stage. In the United States, an estimated 13,800 new cases of cervical cancer will occur in 2020, and an estimated 4,290 women will die of cervical cancer in 2020. Nearly 570,000 new cases of cervical cancer are diagnosed annually world-wide, and more than 311,000 women die from this cancer each year. Virtually all

cases are linked with persistent infection with HPV. Challenges with acceptance, accessibility and compliance of vaccines to prevent HPV infection and the resulting pre-cancers and cancers have resulted in only about 40% to 60% of adolescent to young women being vaccinated in the United States, and even lower proportions have been vaccinated in some of the other countries around the world which have access to those vaccines.

While approximately 90% of HPV infections are ultimately cleared naturally by the body's own immune system, persistent cervical infection with one or more HR-HPV genotypes can lead to cervical high-grade squamous intraepithelial lesions (HSILs) and, if untreated, eventually invasive cervical cancer. Researchers have estimated the global prevalence of clinically pre-cancerous cervical HSILs at between 28 and 40 million. HPV-16 and HPV-18 are the two most prevalent high-risk types of HPV worldwide, causing the significant majority of HPV-related cancers. In the United States, HPV-16/18 are found in about 45% to 50% of all cervical HSILs and about 70% of invasive cervical cancers.

The estimated annual incidence of cervical HSIL caused by HPV-16 and/or HPV-18 is approximately 195,000 persons in the United States and 233,000 persons in Europe. We believe these patients represent a significant market opportunity for our product candidates. Cervical HSIL can currently only be treated by an invasive surgical procedure.

To prevent HPV infection, there is currently one FDA-approved preventive vaccine available in the United States, called Gardasil® 9. That vaccine protects against infection by nine total HPV genotypes, consisting of seven genotypes that confer high risk for cancer and two that confer risk for genital warts. However, preventive HPV vaccines cannot treat or protect those already infected with the same HPV genotypes, which is a large population. In addition, many girls and women eligible to be vaccinated have not been receiving these vaccines. In 2017, a U.S. national survey found that only 57% of girls aged 13-17 years were up to date with the HPV vaccine series. Currently there is no viable immunotherapy or drug to fight established HPV infection or treat cervical dysplasia and/or cancer caused by HPV.

Current management options for cervical HSIL are unappealing. The “watch-and-wait” process associated with low grade squamous intraepithelial lesions (LSIL, formerly called low-grade dysplasia or CIN 1) and in some young women with higher grade lesions (CIN 2) is a stressful approach. The only available treatment option for cervical HSIL is surgery, which involves ablating or cutting a women’s cervix to remove the pre-cancerous lesions. While surgical procedures are generally initially effective in removing lesions, they can lead to short-term adverse effects including cervical scarring, excess bleeding and infection, and to longer-term reproductive risks such as pre-term birth, miscarriage, and perhaps infertility. Current excisional and ablative procedures nearly double the overall risk of pre-term births from 5.4% to 10.7%, according to Kyrgiou et al in a major meta-analysis published June 2016 in the *British Medical Journal*. Anticipation of these procedures produces significant anxiety for patients, despite their doctor’s reassurances, and full recovery from surgery can take up to several weeks. Because surgery does not clear the underlying HPV infection, there is a 10-16% chance of high-grade pre-cancer lesion recurrence after surgery as a result of persistent HPV infection and/or incomplete removal of the lesion, with the persistent HPV infection being the better predictor of recurrence.

Our product candidate VGX-3100 is designed to significantly increase T cell immune responses against the E6 and E7 antigens of high-risk HPV types 16 and 18 that are present in both precancerous and cancerous cells transformed by these HPV types. E6 and E7 are oncogenes that play an integral role in transforming HPV-infected cells into precancerous and cancerous cells, thus making them appealing targets for T cell directed immunotherapy. The goal of VGX-3100 is to stimulate the body's immune system to mount a killer T cell response strong enough to cause the killing of cells producing the E6/E7 protein. The potential of such an immunotherapy would be to treat precancerous dysplasias caused by these HPV types.

VGX-3100 for the Treatment of Cervical High-Grade Squamous Intraepithelial Lesion (HSIL)

Phase 2b Study Results

In September 2015, we published clinical data from our randomized, placebo-controlled, double-blind Phase 2b study of VGX-3100 in *The Lancet* in a paper entitled, “Safety, efficacy, and immunogenicity of VGX-3100, a therapeutic synthetic DNA vaccine targeting human papillomavirus 16 and 18 E6 and E7 proteins for cervical intraepithelial neoplasia 2/3: a randomized, double-blind, placebo-controlled Phase 2b trial.” We initiated this study in March 2011 using our CELLECTRA® device in women with HPV type 16 or 18 and diagnosed with, but not yet treated for, cervical HSIL (also called high grade cervical intraepithelial neoplasia (CIN 2/3)).

This paper reported further details regarding the characteristics of T cells generated and their association with efficacy outcomes. Analyses of patient immune responses showed that overall antigen-specific T cell levels in women treated with VGX-3100 were greater than those treated by placebo at all observation periods. At week 14, levels of CD8+ T cells specific to the E6 and E7 HPV antigens in women treated with VGX-3100 were ten times greater than those in the placebo group. This response increased with each of the three immunizations, then declined modestly to a sustained and durable level of T cells (memory T cells) measured through 36 weeks (24 weeks post-treatment).

Patients whose lesions regressed had higher frequencies of HPV-specific CD8+ T cells which co-expressed key molecules important in the T cell killing cascade and directly correlated with clinical efficacy. Specifically, higher levels of CD8+ killer T cells co-expressing checkpoint molecule CD137 on their surface, as well as the cytolytic protein perforin, were observed to be a predictive tool for efficacy. As a strong activation marker for CD8+ T cells, stimulation through CD137 has been shown in some systems to confer resistance of CD8+ T cells to the suppressive activity of regulatory T cells, indicating that its presence can identify tumor reactive T cells. Perforin is a pore-forming protein deployed by killer T cells to bore holes into the target cell's plasma membrane and destroy the cell. The difference in frequencies of CD8+ T cells expressing CD137 and perforin was greatest in patients who had both regressed their lesions and cleared HPV as compared to patients who did not.

To our knowledge, this was the first published study from which a direct correlation between antigen-specific CD8+ T cells generated *in vivo* and clinical efficacy was observed. We have identified several key biomarkers of killer T cells that we believe can be used to predict the clinical efficacy of VGX-3100, as well as other immunotherapies, which we will seek to confirm in our ongoing Phase 3 trial.

Phase 2b Trial Design

The women in the Phase 2b study received either 6 mg of VGX-3100 or a placebo. VGX-3100 and placebo were administered using the CELLECTRA® device at months 0, 1 and 3. The study assessed efficacy by measuring regression of cervical lesions from CIN 2/3 to CIN 1 or normal in the treated versus control subjects. Immunological responses were also measured in this clinical study to assess the ability of this therapy to generate strong T cell responses in a larger, controlled study. Safety was also assessed.

The primary endpoint of the trial, histologic regression, was evaluated 36 weeks after the first treatment. In the per protocol analysis of this three-immunization regimen, CIN 2/3 resolved to CIN 1 or no disease in 53 of 107 (49.5%) women treated with VGX-3100, compared to 11 of 36 (30.6%) who received placebo. This difference was statistically significant ($p=0.017$). Intent to treat results were also similar and statistically significant.

There was also a high level of complete clearance of CIN 2/3 to that of a normal cervix. In a post-hoc analysis, CIN 2/3 resolved to no disease in 43 of 107 (40.2%) women treated with VGX-3100, compared to 6 of 36 (16.7%) who received placebo ($p=0.006$).

A secondary endpoint of the trial was virological clearance of HPV 16 or 18 from the cervix in conjunction with histopathological regression of cervical dysplasia to CIN 1 or no disease. This endpoint was achieved in 43 of 107 (40.2%) VGX-3100 recipients, compared to 5 of 35 (14.3%) placebo recipients ($p=0.001$). We believe this is an important outcome, as persistence of the HPV virus is associated with recurrence of cervical dysplasia.

All Phase 2b patients were monitored for an additional 52 weeks for a safety follow up. No significant safety issues were observed through week 88 following treatment.

Preparation and Launch of VGX-3100 Phase 3 Study

In preparation for pivotal Phase 3 development and commercialization, we completed a manufacturing technology-transfer to a commercial manufacturing facility and scaled up manufacturing of VGX-3100.

We also designed and manufactured a new smart delivery device, CELLECTRA®-5PSP, which is being used in our global Phase 3 clinical trial of VGX-3100. This smart device is a fully automated, smaller and user-friendly hand-held device. The new CELLECTRA®-5PSP smart device is being used in our ongoing VGX-3100 Phase 3 trial, which started in June 2017, and is being developed for potential commercial use.

We have conducted additional market research with physicians and patients that have further characterized the unmet medical needs relating to the treatment of CIN 2/3 cervical dysplasia. These include a preference for a non-invasive, non-surgical procedure for removing cervical lesions; a treatment that can clear HPV, the cause of the pre-cancer, throughout the body and not just in the limited area of the lesion; and a treatment that does not result in pre-term births or infertility. We believe that CIN 2/3 represents a unique market opportunity for a novel therapy capable of providing a first-line alternative to surgery and in some cases even an alternative to watchful waiting. This market research will help guide our communication and interaction with the physician, patient and support communities.

Phase 3 Program for VGX-3100 (REVEAL)

Our Phase 3 program, named REVEAL, consists of a primary study (REVEAL 1) and confirmatory study (REVEAL 2), in accordance with the FDA's general guidance for Phase 3 programs, to be conducted in parallel. The studies will each enroll 198 patients. Mark Einstein, MD, MS, FACS, FACOG, Professor and Chair Department of Obstetrics, Gynecology and Women's Health Assistant Dean, Clinical Research Unit, Rutgers New Jersey Medical School, is Principal Investigator for the studies.

The REVEAL studies are prospective, randomized (2:1), double-blind, placebo-controlled trials evaluating adult women with HPV 16/18 positive biopsy-proven cervical HSIL (CIN 2/3). The primary endpoint is regression of cervical HSIL and virologic clearance of HPV-16 and/or HPV-18 in the cervix, which was a secondary endpoint that was achieved in our Phase 2b trial described above. Overall, the Phase 3 studies will evaluate cervical tissue changes at approximately 9 months after beginning a three-dose regimen of VGX-3100 administered at months 0, 1 and 3. Secondary endpoints include safety; tolerability; regression of CIN 2/3 to CIN 1 or normal; virologic clearance of HPV; efficacy measured by non-progression to cancer; and clearance of HPV from non-cervical anatomic locations.

In June 2019, we completed enrollment of 198 patients for the primary REVEAL 1 trial. Enrollment for the confirmatory REVEAL 2 trial is ongoing.

In May 2019, VGX-3100 was granted an Advanced Therapy Medicinal Product Certificate by the European Medicines Agency, or EMA, for quality and non-clinical data. The procedure of certification of quality and non-clinical data involves an assessment of the available data in view of future registration and the related European Scientific Data Requirements, not including any clinical data or benefit-risk assessment. The granted EMA's certificate confirms that our chemistry, manufacturing and controls (CMC) data and nonclinical results available to date overall comply with the scientific and technical standards for evaluating an EU Marketing Authorization.

VGX-3100 for the Treatment of Vulvar High-Grade Squamous Intraepithelial Lesion (HSIL)

Pre-cancerous lesions of the vulva, or vulvar intraepithelial neoplasia, or VIN, has less than a 5% rate of spontaneous, or natural, regression and there are no FDA approved non-surgical treatments. Surgery, the most common treatment, is associated with high rates of disease recurrence and can cause disfigurement, long-term pain, and psychological distress for the women who undergo the procedure. VIN recurs in approximately one of every two patients who undergo surgical treatment.

In April 2017, we commenced a Phase 2 trial to evaluate the efficacy of VGX-3100 in patients with VIN. This randomized, open-label Phase 2 clinical trial will assess the efficacy of VGX-3100 in 33 women with high-grade HPV-related vulvar lesions. VGX-3100 will be administered with our CELLECTRA[®] intramuscular delivery smart device. The primary endpoint of the study is histologic clearance of high-grade lesions and virologic clearance of the HPV virus in vulvar tissue samples. The study will also evaluate safety and tolerability of VGX-3100.

VGX-3100 for the Treatment of Anal or Perianal HSIL

Left untreated, anal HSIL may progress to cancer. Spontaneous regression of anal HSIL may occur, but only in the range of 20% to 29% of patients after one year of follow-up. Persistent infection with a high-risk HPV genotype is responsible for a large portion of anal cancer. In the United States, about 55% to 80% of anal HSIL cases are associated with HPV-16/18, and worldwide about 80% of anal HSIL cases are associated with HPV-16/18. In the United States, over 90% of anal cancer is attributable to HPV, and about 87% of those HPV anal cancers are attributable to HPV-16/18 specifically.

There are no validated screening tests or a general screening recommendation consensus for anal HSIL. Currently, the treatments for anal HSIL consist of excising or ablating the lesion(s). Treatment usually consists of repeated ablation, most commonly radiofrequency ablation (RFA), resections or laser therapy. However, treatment of anal HSIL represents a significant unmet medical need due primarily to the high recurrence rates up to 49% one year after treatment.

In May 2018, we commenced a Phase 2 clinical trial to evaluate VGX-3100 in patients who are HIV-negative with histologically confirmed anal or perianal HSIL, or anal intraepithelial neoplasia (AIN), associated with HPV 16 and/or 18. The open-label trial enrolled 24 patients who received 3 doses of VGX-3100 delivered by our intramuscular CELLECTRA[®] device. The primary endpoint of the study is histologic clearance of the high-grade lesions and virologic clearance of the HPV 16/18 virus in anal/perianal tissue samples.

In August 2018, in partnership with the AIDS Malignancy Consortium (AMC), we commenced a Phase 2 clinical trial to evaluate VGX-3100 in patients who are HIV-positive with histologically confirmed anal or perianal HSIL associated with HPV 16 and/or 18. The open-label trial will enroll approximately 75 patients who will receive 4 doses of VGX-3100 delivered by our intramuscular CELLECTRA[®] smart device. The primary endpoint of the study is histological regression of high-grade anal lesions to low-grade or normal. The trial is being fully funded by AMC.

VGX-3100 Immune Correlates and Biomarker Signatures

In November 2017, we announced that a post-hoc analysis of data generated from our Phase 2b trial of VGX-3100 identified immune correlates and biomarker signatures that were predictive of potential treatment success. Details of the new biomarker and immunologic data are highlighted in the peer-reviewed journal *Clinical Cancer Research* in the article, "Clinical and Immunologic Biomarkers for Histologic Regression of High-grade Cervical Dysplasia and Clearance of HPV-16 and HPV-18 after Immunotherapy," by us and our academic collaborators.

In May 2019, we entered into a collaboration with QIAGEN N.V. to co-develop a liquid biopsy-based companion diagnostic for the related immune correlates and biomarker signatures to identify patients most likely to respond to VGX-3100.

ApolloBio Collaboration Agreement for VGX-3100 within Greater China

In December 2017, we entered into an amended agreement providing ApolloBio Corporation with the exclusive right to develop and commercialize VGX-3100 within Greater China (defined as China, Hong Kong, Macao and Taiwan). Additional details on the ApolloBio Agreement are provided below under "Business-License, Collaboration and Supply Agreements."

Upon the closing of the transaction in March 2018, we received proceeds of \$19.4 million which comprised the upfront payment of \$23.0 million less \$2.2 million in foreign income taxes and \$1.4 million in certain foreign non-income taxes. We may also receive potential milestone payments of up to \$20 million in the aggregate. In addition, we are entitled to receive double-digit tiered royalty payments on sales. This collaboration of VGX-3100 encompasses the treatment and/or prevention of precancerous HPV infections and HPV-driven dysplasias (including cervical, vulvar and anal precancers) and excludes HPV-driven cancers and all combinations of VGX-3100 with other immunostimulants. The agreement also provides for potential inclusion of the Republic of Korea during the first three years of the term of the agreement.

INO-3107 for the Treatment of Recurrent Respiratory Papillomatosis (RRP)

RRP is a rare disease (estimated at 15,000 active cases in the United States, including both juvenile and adult cases) that is characterized by the growth of tumors in the respiratory tract primarily caused by HPV-6 and/or HPV-11 genotypes. Epidemiologic data are limited, but published clinical reports suggest this disease occurs worldwide. Although benign, papillomas can cause severe, sometimes life-threatening airway obstruction and respiratory complications. A distinguishing aspect of this disease is the tendency for the papilloma to recur after surgical procedures to remove them. Left untreated, if RRP develops in the lungs, affected individuals can potentially experience recurrent pneumonia, chronic lung disease (bronchiectasis) and, ultimately, progressive pulmonary failure. In extremely rare cases (less than 1%), papillomas can become cancerous (malignant transformation) developing into squamous cell carcinoma. Additional symptoms of RRP can include hoarse voice, difficulty in sleeping and swallowing, and chronic coughing. RRP symptoms are usually more severe in children than in adults. In children, the disorder is most often diagnosed at or around the age of four years. In adults, the disorder occurs most often in the third or fourth decade.

On February 3, 2020, we announced the publication of clinical data from a pilot clinical study of INO-3106 (DNA medicine candidate targeting HPV 6-associated RRP) in the scientific journal *Vaccines (MDPI)*. Study results demonstrated that INO-3106 generated immunogenicity and engagement and expansion of an HPV 6-specific cellular response, including cytotoxic T cells. Two out of two patients receiving INO-3106 who previously required approximately two surgeries per year for several years to manage this disease delayed their need for surgery, with one patient able to delay surgery for over a year and a half (584 days surgery-free) and the second remaining surgery-free for over two and a half years (915 days surgery-free).

In February 2020, we commenced an open-label, multicenter Phase 1/2 trial that will enroll approximately 63 subjects in the United States and will evaluate the efficacy, safety, tolerability and immunogenicity of INO-3107 (our new product candidate designed to treat both HPV 6 and 11-associated RRP) in subjects with HPV 6 and/or 11-associated RRP who have required at least two surgical interventions per year for the past three years for the removal of associated papilloma(s). For this study, adult subjects will first undergo surgical removal of their papilloma(s) and then receive four doses of INO-3107, one every three weeks. The primary efficacy endpoint will be a doubling or more in the time between surgical interventions following the first dose of INO-3107 relative to the frequency prior to study therapy. If we obtain sufficient safety and potential efficacy data in adults, we plan to expand the trial to include pediatric patients as well as a potential booster regimen.

In addition to initiating this efficacy trial, we also plan to seek orphan disease designation for INO-3107 from the FDA's Office of Orphan Products Development (OPD). The FDA grants orphan designation to drugs and biologic products that are intended for the safe and effective treatment, diagnosis, or prevention of rare diseases or disorders that affect fewer than 200,000 people in the United States. Orphan disease designation can provide a drug developer with several benefits and incentives, including a period of marketing exclusivity if regulatory approval is ultimately received for the designated indication.

MEDI0457 (VGX-3100 + INO-9012) for the Treatment of HPV-Associated Cancers

Overview and Background

HPV is also associated with some head and neck cancers, especially those in the oropharynx and perhaps to some extent the larynx and oral cavity. The incidence of HPV-caused oropharyngeal squamous cell cancer (OPSCC) has

increased significantly within the last 30 years in the United States, including a 225% increase from 1988 to 2004, an average annual increase of 14%. More recently, from 1999 to 2015, HPV-associated OPSCC incidence in the United States increased among men at an annual average rate of 2.7% and among women at an annual average rate of 0.8%, and by approximately 2009 the incidence of these HPV-associated mouth and throat cancers in men exceeded that of cervical cancers in women. Oropharyngeal cancer is the fastest-rising cancer among young white men in the United States, and U.S. men in general are about four times more likely than women to be diagnosed with HPV-associated oropharynx cancer. Increasing trends of the cancer in the United States are projected to continue at least through the year 2030. The estimated U.S. prevalence of HPV-caused oral cavity and pharynx cancer was approximately 108,000 cases in 2015.

In 2015, OPSCC was the most common HPV-associated cancer in the United States, with nearly 19,000 new cases diagnosed that year (15,479 cases among men and 3,438 cases among women). An estimated 53,260 new cases of this cancer in general, whether or not HPV-associated, are estimated to occur in 2020 in the United States, and an estimated 10,750 persons will die of this cancer in 2020. Worldwide, an estimated nearly 93,000 new cases of oropharyngeal cancer overall occurred in 2018, and about 25,400 to 29,000 cases per year of this cancer are HPV-associated.

Scientists have estimated that by 2030 OPSCC will constitute the majority of all head & neck cancers. About 70% of cancers of the oropharynx are now caused by HPV, with HPV-16 being the most prevalent genotype and causing about 86% of those HPV-caused cancers.

Improvements in primary treatment modalities (surgery and radiation) have produced significant improvements in morbidity, but intensive radiation has a profound long-term impact on mortality and quality of life. Based on these factors, we believe there is a significant opportunity for an effective immunotherapy.

Considering the several known cancers caused by HPV, the relative and total burden of those in terms of the annual U.S. average annual incidence rates and portions attributable to the HPV-16/18 genotypes for the period of 2008 to 2010 (the latest time period for which such HPV association and attribution data are available) are shown in the table below. In total for that period, an average of more than 30,000 cases of HPV cancers per year were diagnosed in the United States, and 80% (nearly 25,000) of those per year were specifically due to HPV-16/18 genotypes.

Annual Incidence of HPV-Attributable Invasive Cancers by Site in the United States, 2008-2010

Invasive Cancer tissue site	Avg. n in Sites where HPV is often found (i.e. HPV-associated cancers)	Cancers Attributable to Any HPV n (% of HPV-pos.)	Cancers Attributable to HPV-16/18 n (% of any HPV-attributable)
Oropharynx	14,972	10,567 (100%)	9,118 (86.3%)
Cervix	12,114	10,976 (100%)	8,018 (73.1%)
Anus	5,715	5,203 (100%)	4,537 (87.2%)
Vulva	4,131	2,840 (100%)	2,009 (70.8%)
Vagina	1,106	830 (100%)	609 (73.4%)
Penis	1,183	749 (100%)	567 (75.7%)
Total	39,221	31,164 (100%)	24,858 (80.0%)

Worldwide data estimates for the year 2012 are shown in the table below. For that year, an estimated 630,000 cases of new HPV cancer cases occurred, and more than 70% (430,000) of those cases were specifically due to HPV-16/18 genotypes.

Annual Incidence of HPV-Attributable Cancers by Site Worldwide

Table 3. Relative contribution of HPV 16/18 or HPV6/11/16/18/31/33/45/52/58 to HPV-associated cancers by site and by sex; World, 2012

HPV-related cancer site (ICD-10 code)	Number attributable to HPV ¹	Relative contribution of HPV16/18 ²		Relative contribution of HPV6/11/16/18/31/33/ 45/52/58 ²	
		Percent	Number	Percent	Number
Cervix uteri (C53)	530,000	70.8	370,000	89.5	470,000
Anus (C21)	35,000	87.0	30,000	95.9	33,000
Vulva (C51)	8,500	72.6	6,200	87.1	7,400
Vagina (C52)	12,000	63.7	7,400	85.3	9,900
Penis (C60)	13,000	70.2	9,100	84.6	11,000
Head and neck (C01-06, C09-10, C32)	38,000	84.9	32,000	89.7	34,000
Total HPV-related sites in women	570,000	71.4	410,000	89.6	510,000
Total HPV-related sites in men	60,000	82.3	50,000	90.4	55,000
Total HPV-related sites	630,000	72.4	460,000	89.7	570,000

MEDI0457 for the Treatment of Head & Neck Cancer

In June 2014, we initiated a Phase 1 clinical trial assessing the immunogenicity and safety of our product candidate INO-3112 (consisting of a combination of VGX-3100 and our product candidate INO-9012) in head & neck cancer patients. INO-3112 is now called MEDI0457, following our collaboration with AstraZeneca, described below. We added INO-9012, a DNA-based IL-12 immune activator, to VGX-3100 for this cancer study because our prior HIV vaccine clinical study had indicated that the addition of IL-12 to our DNA medicine could enhance the activation of CD8+ T cells.

We enrolled 22 adults with HPV16 and/or HPV18-positive head & neck squamous cell carcinoma (HNSCC) in this open-label Phase 1 trial. Patients were treated with four doses of MEDI0457 and then followed for safety, immune and clinical responses. In one part of the study, six patients were treated once with MEDI0457 before and after resection of their tumor. These patients received three additional doses subsequent to surgery and chemoradiation therapies. In the second part of the study, 16 patients were recruited into the study after their surgery and completion of chemotherapy and radiation therapy. These patients were treated with four doses of MEDI0457 and followed. Each MEDI0457 treatment was administered using our CELLECTRA[®] smart delivery system.

In November 2016, at the Annual Meeting of the Society for Immunotherapy of Cancer (SITC), we reported interim immunology results showing that in the group of six patients treated before resection (one dose averaging 14 days and ranging 7 to 28 days prior to definitive surgery) and post-surgery (three additional doses), MEDI0457 generated robust HPV16/18 specific CD8+ T cell responses in peripheral blood in four of five subjects who also showed increased T cell activation in resected tumor tissue samples. One subject withdrew consent after surgery, leaving five evaluable subjects in this group.

In October 2018, we announced a paper published in *Clinical Cancer Research*, a major cancer journal, detailing results of a patient with head and neck cancer treated with MEDI0457 who achieved a sustained complete response (full remission) on treatment with a subsequent PD-1 checkpoint inhibitor. In our sponsored study of 22 patients with head and neck squamous cell carcinoma we reported 91% (20/22) of patients showed T cell activity in the blood or tissue.

In January 2019, we announced that a second patient with HPV-related head and neck cancer treated with MEDI0457 in a Phase 1 trial achieved a sustained complete response (full remission) after subsequent treatment with a PD-1 checkpoint inhibitor.

Both patients who achieved full cancer remission were treated with four doses of synthetic DNA medicine as part of the Phase 1 trial. This response indicates that synthetic DNA medicine generated robust HPV16/18 specific CD8+ T cell responses in peripheral blood and increased CD8+ T cell infiltration in resected tumor tissue samples.

Of the four patients who developed progressive disease and were subsequently administered a PD-1 checkpoint inhibitor, two patients rapidly exhibited a complete response. The most recent patient for which data was presented in January 2019 received pembrolizumab (KEYTRUDA[®]), while the previously reported complete responder was treated with nivolumab (OPDIVO[®]). The patients moved from metastatic head and neck cancer to no evidence of disease and they remain alive two years after treatment.

Increasing evidence suggests that response rates from checkpoint inhibitors can be enhanced when used in combination with cancer vaccines like MEDI0457 that generate tumor-specific T cells. Interim data from a MEDI0457 monotherapy study of head and neck cancer patients demonstrated that MEDI0457 generated robust HPV16/18 specific CD8+ T cell responses in peripheral blood and increased CD8+ T cell infiltration in resected tumor tissue samples.

Collaboration with AstraZeneca

In August 2015, we formed a strategic collaboration with MedImmune, the global biologics research and development arm of AstraZeneca (AstraZeneca), focused on cancer immunotherapies. Under this agreement AstraZeneca licensed INO-3112 (renamed MEDI0457), to be studied in combination with selected immunotherapy molecules within its pipeline in HPV-associated cancers. See “Business- License, Collaboration and Supply Agreements” for additional information about the collaboration agreement.

In May 2017, we announced that AstraZeneca will conduct a Phase 1/2 clinical trial investigating the combination of MEDI0457 and durvalumab, a PD-L1 checkpoint inhibitor. The combination trial will enroll patients with metastatic HPV-related HNSCC with persistent or recurrent disease after chemotherapy treatment.

The open-label clinical trial is evaluating the safety and efficacy of the combination therapy in 35 subjects with metastatic head and neck cancer at multiple U.S. sites. Subjects will receive multiple doses of MEDI0457 and durvalumab. The primary endpoints of the trial are safety and objective response rate. The trial will also evaluate immunological impact, progression-free survival and overall survival. The Phase 2 portion of this study was initiated in December 2017, and this initiation triggered a \$7 million milestone payment from AstraZeneca to us.

In December 2018, we announced the dosing of the first patient in an open-label, Phase 2 combination trial to evaluate MEDI0457, in combination with durvalumab, in patients with HPV-associated cervical, anal, penile and vulvar cancers. This trial, which is being funded by AstraZeneca, has an estimated total enrollment of 77 patients.

The first dosing of a cervical cancer patient in this trial resulted in an additional \$2.0 million milestone payment from AstraZeneca to us in 2018. A first dosing of a patient with a third distinct HPV-associated cancers other than H&N or cervical triggered another \$2.0 million milestone payment in April 2019.

Under our collaboration agreement, AstraZeneca will fund all of the costs of developing MEDI0457.

INO-5151 (INO-5150 + INO-9012) for the Treatment of Prostate Cancer

In the United States in 2020, there will be an estimated 191,930 new cases of prostate cancer and more than 33,330 deaths occurred due to this cancer. Worldwide in 2018, an estimated 1.28 million new cases of and nearly 360,000 deaths occurred due to this cancer.

In July 2015, we initiated a Phase 1 trial to evaluate our DNA immunotherapy for prostate cancer, INO-5150, in men with biochemically relapsed prostate cancer. This study is evaluating the safety, tolerability and immunogenicity of INO-5150 alone or in combination with INO-9012. The multi-centered study is also evaluating changes in prostate specific antigen, or PSA, levels, an important biomarker in prostate cancer. We have fully enrolled 62 patients in the trial across 4 dose cohorts.

An interim data analysis presented in September 2017 at the European Society of Medical Oncology (ESMO) meeting in Madrid, Spain showed that INO-5150 had generated antigen-specific CD8+ killer T cell responses measured in peripheral blood from subjects with biochemically recurrent prostate cancer. Treatment with INO-5150 as a monotherapy generated PSA and prostate specific membrane antigen, or PSMA, specific T cell responses in peripheral blood in 60% (35/58) of the subjects. Patients with specific CD8+ T cell responses experienced dampening in the rise of PSA and significant increases in PSA Doubling Times (PSADT).

In June 2018, additional prostate cancer data from the trial was presented at the American Society of Clinical Oncology (ASCO) annual meeting. The additional data showed clinically meaningful PSA stabilization after administration of INO-5150 in patients, with no documented disease progression during the study. Of note, this effect was also observed in the patients with the fastest PSA doubling at the time of study entry.

In October 2018, we announced new data from the trial in which a slowing of Prostate-Specific Antigen Doubling Time (PSADT) was observed in men with prostate cancer. Eighty-six percent (86%) of patients remained progression-free at Week 72 of the study, and immunogenicity was observed in 77% (47/61) of patients by multiple immunologic assessments. These data were presented in a poster entitled “Synthetic DNA immunotherapy in Biochemically Relapsed Prostate Cancer” at the 2018 European Society for Medical Oncology (ESMO) congress.

In July 2019, we announced a clinical collaboration agreement with Parker Institute for Cancer Immunotherapy (PICI) and the Cancer Research Institute (CRI) in which our prostate cancer immunotherapy candidate INO-5151 will be combined with an immune modulator (CDX-301, FLT3 ligand, a dendritic cell mobilizer) and a PD-1 checkpoint inhibitor (nivolumab) targeting metastatic castration resistant prostate cancer (mCRPC) in a PICI sponsored platform

study. INO-5151 is a combined formulation of INO-5150 (with SynCon® antigens encoding for PSA and PSMA) and INO-9012 (DNA vector expressing interleukin 12).

This combination trial is an open-label, non-randomized, exploratory platform study designed to assess the safety and antitumor activity of multiple immunotherapy based combinations in participants with mCRPC who have received prior secondary androgen inhibition. This study will evaluate biomarkers of immune activity and clinical outcomes using a multi-omic, multi-parameter approach. Our immunotherapy is one arm (Cohort C) of this broad PICI-supported study, which is a multi-arm, multi-stage platform design.

Under the agreement, PICI will design and execute the clinical study, working in collaboration with its established network of the most pre-eminent clinical academic and industry cancer centers, and with funding support from CRI. Based on PICI's novel approach to accelerating studies of cancer immunotherapies, we will provide financial contributions based on the actual costs of the study, if our product(s) studied under the collaboration reaches the initiation of a Phase 3 study.

INO-5401 for the Treatment of Glioblastoma Multiforme (GBM)

INO-5401 is an immunotherapy consisting of three tumor-associated antigens: hTERT, Wilms' tumor gene (WT1) and PSMA. The National Cancer Institute previously highlighted WT1, hTERT and PSMA among a list of attractive cancer antigens, designating them as high priorities for cancer immunotherapy development. WT1 was at the top of the list. The hTERT antigen relates to 85% of cancers and WT1 and PSMA antigens are also widely prevalent in many cancers.

In February 2017, we reported data indicating that our SynCon® WT1 cancer antigen was capable of breaking immune tolerance, a major challenge to researchers striving to develop potent cancer therapies, and induced neo-antigen-like T cell responses to cause tumor regression in pre-clinical studies. The results were published in the scientific journal *Molecular Therapy* in an article entitled, "A novel DNA vaccine platform enhances neo-antigen-like T cell responses against WT1 to break tolerance and induce anti-tumor immunity."

While mice in the preclinical study did not mount an immune response to native mouse WT1 antigens, mice immunized with our SynCon® WT1 antigen broke tolerance and generated robust neo-antigen-like T cells. The immunized mice also exhibited smaller tumors and prolonged survival in a tumor challenge study. SynCon® WT1 DNA vaccination also broke tolerance and generated neo-antigen-like T cell immune responses in Rhesus monkeys, a species whose immune system closely resembles that of humans. The ability to overcome the immune system's usual tolerance of WT1 antigen suggests the potential of our SynCon® WT1 antigen to tackle any WT1-expressing cancer in humans, including pancreatic, brain, lung, thyroid, breast, testicular, ovarian, and melanoma.

We previously reported similar results for our SynCon® hTERT and PSMA cancer antigens.

These attributes of breaking tolerance and having broader prevalence across different cancers create the potential for INO-5401 to be an effective universal cancer immunotherapy in combination with different checkpoint inhibitors.

We are developing INO-5401 for the treatment of GBM, a devastating disease for both patients and caregivers. GBM is the most aggressive brain cancer and its prognosis is extremely poor, despite a limited number of new therapies approved over the last 10 years. The latest available U.S. data for GBM is for the period of 2011 to 2015, when an average annual number of reported new cases was 11,229. The median overall survival for patients receiving standard of care therapy is approximately 15 months, and the average five-year survival rate is only 5.8% for urban residents and only 3.9% for rural residents.

In June 2018, we dosed the first patient as part of a Phase 1/2 immuno-oncology trial in patients with newly diagnosed GBM. The trial is designed to evaluate INO-5401 and INO-9012, in combination with cemiplimab (REGN2810 or Libtayo®), a PD-1 inhibitor developed by Regeneron Pharmaceuticals.

The open-label trial of 50 newly diagnosed GBM patients is being conducted at approximately 25 U.S. sites, and the primary endpoint is safety and tolerability. The study will also evaluate immunological impact, progression-free survival and overall survival.

In November 2019, we provided interim results from the Phase 2 study of newly diagnosed GBM patients. Key interim data from the 52-patient clinical trial showed that 80% (16 of 20) of MGMT gene promoter methylated patients and 75% (24 of 32) of unmethylated patients were progression-free at six months (PFS6) measured from the time of their first dose, substantially exceeding historical standard-of-care data.

This immunotherapy combination with a PD-1 checkpoint inhibitor also exhibited supportive safety, tolerability, and immunogenicity data and suggested a safety profile consistent with that of Libtayo® and our other product candidates. The majority of patients tested had a T cell immune response to one or more tumor-associated antigens encoded by INO-5401. Immune responses to all three tumor-associated antigens were demonstrated in this study.

In July 2019, we announced the discontinuation of our Phase 1/2 study of INO-5401 in advanced bladder cancer. Although the bladder trial had yet to provide evaluable data, we decided to discontinue the study primarily due to several new therapeutic alternatives that have been approved, or that we believe are likely to be approved, for patients since the trial's design and inception.

Infectious Disease Product Candidates

Our product development platform also allows for rapid design, pre-clinical testing, manufacturing and clinical development of our vaccine and immunotherapy product candidates. In 2016, we were the first entity able to advance a Zika vaccine into human clinical trials, just 4.5 months after World Health Organization, or WHO, declared the emerging Zika infections to be a Pandemic Health Emergency of International Concern. Previously, we led the development of the first MERS vaccine in human clinical trials. More recently, our product platform and SynCon® sequencing capabilities allowed us to rapidly respond to the coronavirus outbreak of 2020, as we began preclinical testing in January 2020 and have started preparations for clinical product manufacturing. We believe that our development platform is well positioned to support global health agencies in order to develop preparedness countermeasures against bioterrorism and/or emerging pandemic agents.

HIV

Overview

Since its discovery in 1981, HIV, the virus which causes AIDS, has killed an estimated 23.6 million to 43.8 million people. Worldwide in 2018, there were an estimated 1.4 million to 2.3 million new HIV infections and 570,000 to 1.1 million deaths due to HIV. That year worldwide, an estimated 32.7 million to 44.0 million people were living with HIV worldwide. In 2018 in the United States and dependent areas (including Washington, DC and Caribbean and Pacific territories), 37,832 people received an HIV diagnosis. At the end of 2017, about one million people in the United States were living with HIV.

Effective vaccines have been actively pursued for over 30 years, without significant success. HIV represents one of the most confounding targets in medicine. The virus's high mutagenicity (ability to mutate) has made effective vaccine development very challenging. Its outer envelope, swathed in sugar molecules, is difficult to attack, and HIV strikes the very cells that the immune system launches to thwart such an infection. Although several drugs (anti-retrovirals) are available to treat the patients once they are infected, vaccines and immunotherapies are necessary to stop the spread of disease and perhaps reduce the need for anti-retroviral treatment.

Noting that many long-term survivors have high counts of killer CD8+ T cells, the HIV vaccine and immunotherapy field has turned to stimulating the immune system to generate those cells. Recent HIV vaccine candidates used an adenovirus (a common human cold virus) genetically modified to contain code for HIV antigens to prevent viral replication. These vaccines have proven to not be effective. Somewhat recently, the RV-144 trial, which employed an ALVACTM (canary pox) vaccine prime followed by a protein vaccine boost, demonstrated 30% efficacy in preventing acquisition of infection amongst the vaccinated population compared to the control group. Although the efficacy was relatively modest, the finding for the first time showed that an immunotherapy may be able to combat spread of HIV and has spurred the development of newer immunotherapy candidates. However, quite recently the HVTN 702 Uhambo trial, which was assessing a prime-boost vaccine based on the regimen tested in the RV144 trial, was halted for new administrations of vaccine due to a non-safety finding of non-efficacy by the trial's independent data and safety monitoring board (DSMB). Therefore, we continue to believe, that a different approach is needed to develop an effective vaccine or immunotherapy for HIV.

Preclinical and Clinical Development - HIV

PENNVAX®-GP - Preventive and Therapeutic Immunotherapies

PENNVAX®-GP is a developmental vaccine intended to prevent and treat HIV strains present in Africa, Asia, Europe, and North America. Using our SynCon® technology, it has been optimized to target two env antigens, as well as gag and pol antigens. This comprehensive targeting gives PENNVAX®-GP the potential to provide global coverage against HIV-1 subtypes. PENNVAX®-GP is delivered intramuscularly using our CELLECTRA® smart delivery device. The development of the PENNVAX®-GP program was funded by a seven-year, \$25 million NIAID contract to us and our collaborators.

In September 2015, the first patient was dosed in a Phase 1 trial to evaluate the safety and tolerability of PENNVAX®-GP. This trial was conducted in collaboration with the HIV Vaccine Trials Network (HVTN). The trial measured immune responses following administration of the vaccine in four groups of healthy subjects receiving the vaccine with and without an immune activator (IL-12) and delivered into muscle or skin using our CELLECTRA® smart delivery technology.

In May 2017, we announced results from the trial, in which PENNVAX[®]-GP produced among the highest overall levels of immune response rates (cellular and humoral) ever observed in a human clinical trial by an HIV vaccine.

Overall, 71 of 76 (93%) evaluable vaccinated participants showed a CD4+ or CD8+ T cells cellular immune response to at least one of the four vaccine antigens. Similarly, 62 of 66 (94%) evaluated participants had an env specific antibody response. None of the placebo recipients (0 of 9) had either a cellular or an antibody response in the study. Notably, amongst the participants receiving PENNVAX[®]-GP vaccine and IL-12 with intradermal immunization, 27 of 28 (96%) participants achieved a cellular response and 27 of 28 (96%) achieved an HIV env specific antibody response.

Amongst the evaluated participants receiving PENNVAX[®]-GP and IL-12 via intramuscular vaccination, 27 of 27 (100%) achieved a cellular response and 19 of 21 (90%) achieved an env specific antibody response. Similar immune responses and response rates were achieved via both intradermal and intramuscular administration of the vaccine, even though participants vaccinated via intradermal administration received 1/5th of the dose of vaccine compared to those vaccinated via intramuscular administration.

In addition to our NIAID contract that funded our Phase 1 clinical trial of PENNVAX[®]-GP, in 2015, we and our collaborators were awarded an additional \$16 million Integrated Preclinical/Clinical AIDS Vaccine Development (IPCAVD) grant from the NIAID. We are using this additional grant to design and test new PENNVAX[®] envelope constructs with our DNA-based immune activator encoding novel cytokine genes in a prime-boost strategy with recombinant HIV envelope proteins. Our collaborators are assessing different combinations in preclinical models with the goal of generating high levels of neutralizing antibodies mirroring the robust CD8+ T cell responses generated by our PENNVAX[®]-B DNA vaccine in previously published clinical studies. The overall goal of this project is to further build upon this important HIV vaccine approach as well as to gain fundamental insight into new technologies to improve vaccination outcomes.

In March 2017, we and our collaborators received an additional multi-year \$7.0 million grant from NIAID to develop a single or combination therapy using PENNVAX[®]-GP, with the goal of attaining long-term HIV remission in the absence of antiviral drugs. This is a two-step clinical study in HIV-positive subjects to assess PENNVAX[®]-GP with INO-9012 alone and with the addition of a PD-1 checkpoint inhibitor. All trials will be randomized, double-blind, placebo-controlled assessments of PENNVAX[®]-GP and will be conducted at the University of California in San Francisco and Los Angeles.

In August 2018, we announced that the first participant had been dosed with PENNVAX[®]-GP in a Phase 1/2 clinical trial designed to evaluate its ability to drive remission of HIV infection. This Phase 1/2 HIV trial is a randomized, double-blinded, placebo-controlled study. The trial is divided into two cohorts and all vaccines are being delivered via the CELLECTRA[®] smart device. In the main study (Cohort A), 45 HIV-infected adults who initiated antiretroviral therapy during chronic infection will receive either PENNVAX-GP, another vaccine formulation that contains only Gag/Pol antigens, or a placebo. Both vaccines are also co-administered with INO-9012. In the single arm and uncontrolled second study (Cohort B), individuals who initiated antiretroviral therapy during acute HIV infection will receive PENNVAX-GP together with INO-9012.

In October 2018, we announced preliminary results from the Phase 1/2 trial, in which PENNVAX[®]-GP delivered via intradermal route resulted in durable and robust antibody and T cell immune responses measured throughout the duration of the study. In this study, PENNVAX-GP plasmids were delivered intradermally or intramuscularly with CELLECTRA[®] smart device in healthy volunteers. PENNVAX-GP delivered intradermally (ID) with CELLECTRA[®] generated equivalent or superior immune responses compared to the delivery via intramuscular (IM) route using the same delivery device, with ID delivery using only one-fifth of the dose compared to IM delivery.

HIV dMAb[®]

In July 2016, we announced that our DNA-based monoclonal antibody technology will be deployed to develop product candidates that could be used alone and in combination with other immunotherapies in the pursuit of new ways to treat and potentially cure infection from HIV. See the section below titled "Synthetic DNA-based Monoclonal Antibodies" for more details on this technology.

Ebola Virus Disease (EVD)

Overview

The Ebola virus causes one of the most virulent viral diseases, with case fatality rates averaging 50% but approaching up to 90% in past outbreaks in areas with no or under-developed health care. Ebola can spread through human-to-human transmission by direct contact with the blood, secretions, organs or bodily fluids of an infected individual and with surfaces or materials that contain the contaminated fluids of an infected person, such as bedding and clothing. It is capable of causing death within two to twenty-one days of exposure. In November 2019, the first conditional approval was issued for a preventive vaccine against Ebola Virus Disease (EVD). This approval was from

the European Medicines Agency (EMA) for the vaccine ERVEBO®. That same month, the World Health Organization (WHO) pre-qualified that vaccine for use in high-risk countries. In the next month, the FDA approved that vaccine. However, there are no proven effective therapeutic treatments for Ebola. In addition, various experimental approaches have already been associated with undesirable side effects and limited ability to scale manufacturing.

According to the U.S. Centers for Disease Control and Prevention (CDC), the 2014 West Africa Ebola epidemic was the largest in history, resulting in 28,610 suspected and confirmed cases and 11,308 deaths as of June 2016, when it was declared over.

In 2018, two Ebola outbreaks occurred, both in the Democratic Republic of Congo (DRC). The first of these outbreaks was declared in May and was relatively well-contained and short-lived, with a total of 54 cases and 33 deaths through the declared end of the outbreak in July. However, the second outbreak (the North Kivu outbreak), which was declared in August, persisted and continues into 2020. This second outbreak became the second largest Ebola outbreak in history, with a total of 3,444 cases, 2,264 deaths, and many thousands of contacts having been followed as of February 2020. On that date, approximately 620 contacts were being followed. This particular outbreak has a 66% case fatality rate as of February 2020. Of the confirmed plus 134 probable cases through that date, about 172 (5%) have been health care workers. As of January 2019, of the 63 health workers which had become infected with Ebola virus 21 of them have died.

Preclinical and Clinical Development - Ebola

In 2014, we entered into a collaboration with GeneOne to advance a DNA immunotherapy for Ebola into clinical development. The decision to advance our Ebola immunotherapy was based on positive results observed in preclinical studies, in which 100% of immunized guinea pigs and mice were protected from death after being exposed to the Ebola virus. Unlike the non-immunized animals, immunized animals were also protected from weight loss, a measure of morbidity. Researchers found significant increases in neutralizing antibody titers and strong and broad levels of immunotherapy-induced T cells, including "killer" T cells, suggesting that DNA immunotherapy could provide both preventive and treatment benefits. This data was published in 2013 in the peer-reviewed journal *Molecular Therapy* in a paper titled, "Induction of Broad Cytotoxic T Cells by Protective DNA Vaccination Against Marburg and Ebola."

In April 2015, we received a contract from the Defense Advanced Research Projects Agency (DARPA) to lead a consortium to develop multiple treatment and prevention approaches against Ebola. Other collaborators are AstraZeneca; GeneOne and its manufacturing subsidiary, VGXI, Inc.; and David B. Weiner, Ph.D., a director of our company, who also serves as executive vice president at the Wistar Institute and retired professor of Pathology and Laboratory Medicine at The Perelman School of Medicine at the University of Pennsylvania, Emory University and Vanderbilt University. A previous collaboration agreement with GeneOne for Ebola was incorporated into this consortium funded by DARPA.

We are taking a multi-faceted approach to develop products to prevent and treat Ebola infection. These programs include development and early clinical testing of:

- a therapeutic DNA-based monoclonal antibody product against the Ebola virus infection, which we believe has properties that best fit a response to the outbreak in that they could be designed and manufactured expediently on a large scale using common fermentation technology, are thermal-stable, and may provide more rapid therapeutic benefit;
- a highly potent conventional protein-based therapeutic monoclonal antibody (mAb) product against Ebola virus infection; and
- a DNA-based vaccine against Ebola.

Our contract with DARPA covers the pre-clinical development costs for the dMAB products and protein mAb candidates, as well as GMP manufacturing costs and the Phase 1 clinical trial costs for the three product candidates described above.

In May 2015, we and our collaborators initiated a Phase 1 clinical trial of INO-4212, an Ebola DNA vaccine to evaluate its safety, tolerability and immune responses in 75 healthy subjects divided into five study arms. INO-4212 consists of two optimized SynCon® DNA plasmids coding for the Ebola glycoprotein antigen from circulating Ebola strains from 1975-2014. The study was designed to evaluate INO-4212 and its components INO-4201 and INO-4202, alone or in combination with INO-9012, delivered into muscle or skin using our proprietary DNA smart delivery technology.

In March 2016, we reported initial results from the trial. Of 69 evaluated subjects, 64 (92.8%) seroconverted and mounted a strong antibody response to the Ebola glycoprotein antigen following the three dose immunization regimen; 48 subjects (69.6%) seroconverted after only two doses.

In the study arm using intradermal (skin) administration, 13 of 13 evaluable subjects (100%) generated antigen-specific antibody responses after only two doses, and all remained seropositive after three immunizations. Similarly, in the study arm receiving the vaccine with intramuscular administration in combination with plasmid IL-12, 13 of 13 evaluable subjects (100%) produced strong antibody responses after three immunizations, and 12 of 13 (92.3%) achieved strong antibody responses after only two immunizations.

The Ebola glycoprotein specific geometric mean antibody titers measured in the five cohorts ranged from over 2,000 to greater than 46,000. Significantly, a majority of vaccinated subjects in each of the five cohorts produced strong Ebola antigen specific T cell responses as measured by interferon gamma ELISpot analysis.

INO-4212 was well tolerated, with no systemic serious adverse effects observed. Side effects, such as fever, joint pain, and low white blood cell counts have previously been reported following treatment with some viral vector based Ebola vaccines currently in development. Moreover, unlike the viral vectored vaccines which must be kept frozen, the INO-4212 formulation used in the trial was kept in a solution which was refrigerated at 2-8 degrees Celsius.

In August 2016, we announced that enrollment of this study was being expanded to up to 200 subjects to further characterize and identify in humans the most optimal immunization regimen using intradermal (skin) delivery of the Ebola DNA vaccine.

In April 2017, we reported preliminary results from the expanded Phase 1 trial. Across both stages of the trial, including both intramuscular and intradermal delivery, 95% (170/179) of evaluable subjects generated an Ebola-specific antibody immune response, with the mean antibody titer comparable or superior to those reported from viral vector-based Ebola vaccines. Our Ebola vaccine was also well tolerated in the second stages of the trial, with a favorable safety profile compared to viral vector-based Ebola vaccines, some of which have been associated with serious adverse events including myalgia, arthralgia, fever, and rash.

In October 2018, we announced that INO-4212 provided 100% protection following a challenge with a lethal dose of the Ebola virus in a preclinical study. An article in the *Journal of Infectious Diseases* highlights that regimens of the INO-4212 vaccine delivered by intramuscular administration provided 100% protection against a lethal Ebola challenge in all preclinical animals. In a separate study, two injections by intradermal administration generated strong immunogenicity and provided 100% protection against a lethal Ebola challenge. In the study, scientists observed that vaccination induced long-term immune responses in monkeys that were detectable for at least one year after the final vaccination.

In March 2019, Phase 1 clinical data of our Ebola vaccine candidate INO-4201 was published in *The Journal of Infectious Diseases*, in the article entitled, "Intradermal SynCon® Ebola GP DNA Vaccine is Temperature Stable and Safely Demonstrates Cellular and Humoral Immunogenicity Advantages in Healthy Volunteers." We believe that this study, which is being fully funded by U.S. Defense Advanced Research Projects Agency (DARPA), further supports the advancement of the intradermal delivery platform for emerging infectious diseases. Significantly, intradermal (skin) administration with our CELLECTRA® smart delivery device resulted in 100% of evaluable subjects in the study generating antigen-specific antibody responses that persisted for more than one year in most subjects and generated T cell responses equivalent to or better than the group that received intramuscular delivery. We believe these published data further validate the tolerability, potency, and product stability advantages of our vaccine and immunotherapy platform.

Our Ebola vaccine candidate was evaluated in five groups of healthy subjects. Of 70 evaluated subjects, 67 (96%) seroconverted and mounted a strong antibody response to the Ebola glycoprotein antigen following the three dose immunization regimen; 52 subjects (74%) seroconverted after only two doses.

Significantly, in the study arm using intradermal (skin) administration, 13 of 13 evaluable subjects (100%) generated antigen-specific antibody responses after only two doses and all remained seropositive after three immunizations.

To date INO-4201 has been well-tolerated and has not demonstrated systemic serious adverse effects, such as fever, joint pain, and low white blood cell counts, reported in association with some viral vector-based Ebola vaccines currently in development.

Middle East Respiratory Syndrome (MERS)

Overview

MERS is a viral respiratory illness first reported in Saudi Arabia in 2012. MERS appears to have been transmitted from an animal reservoir to humans but human to human transmission has been confirmed. This communicable virus has not been shown to spread in a sustained way in communities, but rapid spread in the nosocomial setting, such as emergency rooms and/or hospitals without adherence to state-of-the-art infection control practices, can result in outbreaks with many cases, including super-spreading events. Like the severe acute respiratory syndrome (SARS)

outbreak in 2003, which made approximately 8,000 people ill and was fatal in nearly 10% of those cases, MERS is caused by a coronavirus and appears to cause a severe lung infection. However, the case-fatality rate (death rate) of MERS has typically been between 30% and 40%, which is significantly higher than that of SARS. While the SARS epidemic in 2003 killed 10% of those who became ill from the SARS virus, MERS has killed approximately 34% of people who people who became ill from the MERS virus from 2012 to January 2020. MERS differs in that it also causes rapid kidney failure. Its high death rate has caused serious concern among global health officials.

Despite the continuing threat of MERS outbreaks, there are no licensed vaccines or treatments for MERS. Since the virus was first identified in Saudi Arabia in 2012, the World Health Organization reports 2,519 laboratory-confirmed cases of MERS and 866 deaths from MERS worldwide as of January 2020. Twenty-seven countries have reported cases, including Korea where an outbreak in the summer of 2015 resulted in 186 cases and 38 deaths. The majority of MERS cases reported in the world by country have been reported from the Kingdom of Saudi Arabia, with a total of 2,121 cases, 788 associated deaths, and a case-fatality rate of 37% from 2012 through January 2020. Of those cases to date in Saudi Arabia, nearly 20% have been in healthcare workers.

Preclinical and Clinical Development - MERS

In November 2013, we announced that preclinical testing of our SynCon® MERS vaccine candidate, INO-4700 (GLS-5300), had induced robust and durable immune responses in mice, demonstrating the potential for such a vaccine to prevent and treat this deadly virus. DNA medicine constructs targeting multiple MERS antigens were designed using our SynCon® vaccine platform with the goal to universally protect against multiple strains of MERS, which has been shown to have diverse genetic variants. These SynCon® constructs were administered via our CELLECTRA® smart delivery technology.

A consensus MERS "spike" protein vaccine construct was created based on multiple strains of the MERS virus. Our MERS DNA medicine was immunogenic in mice and seroconversion was observed in all animals. The antibodies generated by the vaccine in 100% of mice (20 of 20) were able to neutralize or completely block actual infection of MERS virus in the cells, demonstrating the protective potential of this vaccine. In contrast, none of the 10 unvaccinated mice in the control group generated neutralizing antibodies.

The vaccinations were also highly T cell immunogenic, generating robust and broad T cell responses as extensively analyzed by the standardized T cell ELISPOT assay. The vaccine produced robust CD8+ and CD4+ T cell responses against multiple epitopes of the MERS spike protein. This increased diversity and magnitude of cellular responses may be critical for effectively mitigating MERS infection.

We believe these preclinical findings are vital given the importance of neutralizing antibodies in preventing infection and the role T cells play in clearing infection by killing cells that harbor the virus.

In August 2015, we announced that our MERS vaccine had induced 100% protection from a live virus challenge in a preclinical study in mice, camels and monkeys, or non-human primates. In all three species, the vaccine induced robust immune responses capable of preventing the virus from infecting cells. We believe the data from camels is an important finding because camels represent not only a host reservoir of the disease, but also act as a mode of transmission to humans. In monkeys, all vaccinated animals in the study were protected from symptoms of MERS disease when challenged with a live MERS virus.

The preclinical results appeared in the peer-reviewed journal *Science Translational Medicine* in an article entitled, "A synthetic consensus anti-spike protein DNA vaccine induces protective immunity against Middle East Respiratory Syndrome Coronavirus in non-human primates."

In February 2016, we and our collaborator GeneOne commenced a Phase 1, dose-escalation clinical trial of INO-4700 (GLS-5300) in 75 healthy volunteers at the Walter Reed Army Institute of Research (WRAIR) in Maryland. The primary and secondary goals of this first-in-man Phase 1 trial are to obtain safety and immunogenicity data. This trial represents the first MERS vaccine to be tested in humans for this disease that has no approved vaccines or treatments.

In December 2016, we announced that the International Vaccine Institute (IVI) will provide new funding and support to further advance the clinical development of INO-4700 (GLS-5300). IVI will add technical, laboratory and financial support for INO-4700 (GLS-5300) clinical trials in Korea with the goal to advance clinical testing toward emergency use authorization by the Korean government as well as authorities of other countries. This collaborative funding is part of a grant from the Samsung Foundation to IVI to support the development of a MERS vaccine for emergency use in Korea and internationally.

In April 2018, we announced a collaboration with The Coalition for Epidemic Preparedness Innovations (CEPI) under which we will develop vaccine candidates against MERS. CEPI will fund up to \$56 million of costs to support our

pre-clinical and clinical advancement through Phase 2 of INO-4700. The goal of the collaboration is for the MERS vaccine to be available as soon as possible for emergency use.

In June 2018, we announced positive results from the Phase 1 trial of INO-4700 (GLS-5300) for MERS. In the trial, treatment with INO-4700 (GLS-5300) was well tolerated and resulted in overall high levels of antibody responses in roughly 95% of subjects, while also generating broad-based T cell responses in nearly 90% of study participants. Antibody responses were observed in 94% of subjects at week 14 (two weeks after the third dose). Additionally, there were no statistically significant dose-dependent differences in antibody response rates (91%, 95%, and 95% at doses of 0.67, 2, and 6 mg, respectively). Durable antibody responses were also maintained through 60 weeks following dosing. These results were published in *The Lancet Infectious Diseases* in a peer-reviewed article entitled, "Safety and immunogenicity of an anti-Middle East respiratory syndrome coronavirus DNA vaccine: A phase 1, open-label, single-arm, dose-escalation trial."

In September 2018, we announced the dosing of the first subject in a Phase 1/2a study of INO-4700 (GLS-5300) for MERS in South Korea funded by IVI.

Zika Virus

Overview

First identified in the late 1940s in Uganda, Zika virus subsequently spread to equatorial Asia in 1969 and then rapidly spread through the Pacific, and still later, in the 2014-2016 period, to and through South America, Central America and the Caribbean. In the end of that period, Zika virus emerged in two portions of the continental United States (extreme Southeastern Florida and extreme South Texas). Zika virus is a flavivirus, a family of viruses including yellow fever, dengue, and West Nile virus, which are introduced to people through mosquito bites. Because the *Aedes* species of mosquitoes that spread Zika virus are found in much of the world, there is concern that the virus will spread to new countries and cause additional outbreaks. There is also concern that Zika spreads sexually in humans, at least by males to females, as has been reported for some returning travelers and documented in multiple studies. In February 2016, the WHO stated that 39 countries had reported locally acquired circulation of the Zika virus since January 2007. Geographical distribution of the virus since expanded, though the incidence of infections declined significantly since the 2014-2016 emergence in the Americas. In 2019, there were no confirmed Zika virus disease cases in the United States. However, currently the CDC still lists at least 92 countries and territories as having risk of Zika virus infection and notes that the virus has potential risk in those areas. No vaccine or drug therapy currently exists for the Zika virus.

The most common symptoms of Zika virus are fever, rash, joint pain, and conjunctivitis. More seriously, health authorities have observed neurological and autoimmune complications potentially associated with Zika virus, including microcephaly in newborn children and Guillain-Barre syndrome. Microcephaly is a rare condition marked by an abnormally small head and incomplete brain development. There may also be a link with Guillain-Barré syndrome, a disease in which the body's immune system mistakenly attacks peripheral nerves. Symptoms start with muscle weakness. In severe cases the person is almost totally paralyzed and the disorder can be life threatening.

In January 2016, we and GeneOne announced a joint research collaboration with academic collaborators of a SynCon® Zika vaccine known as INO-4600 (GLS-5700).

Preclinical Studies - Zika Virus

In February 2016, we announced that INO-4600 (GLS-5700) administered using our CELLECTRA® smart delivery device resulted in seroconversion, or the development of detectable specific antibodies in the blood, in all vaccinated mice. The vaccinations also generated robust and broad T cell responses as analyzed by the standardized T cell ELISPOT assay. In data reported in May 2016, two doses of INO-4600 (GLS-5700) delivered either intramuscularly or intradermally resulted in seroconversion, in all vaccinated non-human primates and broad T cell responses as analyzed by the standardized T cell ELISPOT assay.

These results were later published in *Nature Partner Journals (npj) Vaccines* in November 2016. Additional data indicated that, in the study, INO-4600 (GLS-5700) protected animals from infection, brain damage and death. No INO-4600 (GLS-5700) vaccinated animals were infected with Zika after exposure to the virus. In addition, vaccinated mice were protected from degeneration in the cerebral cortex and hippocampal areas of the brain while unvaccinated mice showed significant degeneration of the brain after Zika infection.

In another preclinical study, the results of which were published in June 2017, INO-4600 (GLS-5700) was observed to have protected against Zika virus-induced damage to testes and sperm, and prevented persistence of the virus in the reproductive tract of all vaccinated male mice challenged with a high dose of the Zika virus. This preclinical study data was published in *Nature Communications* in an article entitled, "DNA Vaccination Protects Mice Against Zika Virus-Induced Damage to the Testes."

Phase 1: 40 Patient Zika Study in U.S. & Canada

In June 2016, we were the first to commence a human Zika trial in healthy adult volunteers, with sites in the U.S. and Canada, with the first subject dosed in July. This Phase 1, open-label, dose-ranging study of 40 healthy adult volunteers was designed to evaluate the safety, tolerability and immunogenicity of INO-4600 (GLS-5700) administered with CELLECTRA[®]-3P, our intradermal smart delivery device.

In this Phase 1 trial, a total of 40 participants (two groups of 20 each) received INO-4600 (GLS-5700) in a 1 mg or 2 mg dose. The vaccine was administered in 0.1 ml intradermal injections. In October 2017, we announced positive safety and immune response results from the Phase 1 trial. The INO-4600 (GLS-5700) Zika vaccine induced binding antibodies in 100% of the participants after a three-dose vaccination regimen and in 95% after two doses of vaccine. In addition, neutralizing antibodies were observed in more than 95% of the serum samples that were assayed on neuronal-cell targets. Serum samples from vaccinated subjects when subsequently transferred to mice were found to be protective from death and illness in more than 90% of animals after they were challenged with a lethal dose of the Zika virus. These results appeared in the *New England Journal of Medicine* in the article, "Safety and Immunogenicity of an Anti-Zika Virus DNA Vaccine."

Phase 1: 160 Patient Zika Study in Puerto Rico

In August 2017, we and GeneOne initiated a second clinical trial of INO-4600 (GLS-5700). In this second trial, we have enrolled 160 subjects in Puerto Rico, where the Zika virus outbreak was declared a public health emergency. In this placebo-controlled, double-blind trial involving healthy adult volunteers, 80 subjects received INO-4600 (GLS-5700) and 80 subjects received placebo. The study is evaluating the safety, tolerability and immunogenicity of INO-4600 (GLS-5700) administered with our CELLECTRA[®]-3P smart device. We are also assessing differences in Zika infection rates in participants given either placebo or vaccine as part of an exploratory endpoint.

Zika dMAb[®]

In December 2016, we received a sub-grant through The Wistar Institute to develop a DNA-based monoclonal antibody designed to provide a fast-acting treatment against Zika infection and its debilitating effects. The goal of this program, which was funded by the Bill & Melinda Gates Foundation, is to develop a Zika dMAb[®] through human clinical trials. In the first quarter of 2019, we dosed our first subject with a Zika dMAb. See the section below entitled "Synthetic DNA-based Monoclonal Antibodies" for further information on our DNA-based monoclonal antibody program.

Lassa Fever

Overview

Lassa fever, also known as Lassa hemorrhagic fever, is an acute viral disease which occurs mostly in West Africa. The disease can cause a range of outcomes including fever, vomiting, and swelling of the face, pain in the chest, back and abdomen, bleeding of various parts of the body including the eyes and nose, and death. This infection is spread through contact with infected rodents. Person to person transmission is also possible, via bodily fluids, albeit less common. Lassa virus infection in West Africa is estimated to affect 300,000 people annually, resulting in approximately 5,000 deaths, as disease and infection surveillance has been poor. Because of difficulties in diagnosing Lassa fever and the remoteness of many areas in which the disease occurs, the numbers of cases and deaths are likely under-reported. Though the majority (about 80%) of Lassa virus-infected persons are asymptomatic or have mild symptoms, the infection can be quite serious to fatal in others. There are no licensed vaccines or treatments specifically for Lassa. The case-fatality among patients hospitalized for Lassa fever is about 15% to 20%, and in some epidemics case-fatality has reached 50% in hospitalized patients, such as in the 2015-2016 Nigeria portion of the West Africa outbreak. Of the survivors of Lassa fever, about one-third have sudden-onset hearing loss. In Nigeria, an unprecedented outbreak occurred in 2018, with more cases recorded and reported in the first two months than in any previous full year there. From January 1 to December 31, 2018, a total 633 confirmed and 20 probable cases were reported to the Nigeria Centre for Disease Control with 171 deaths among confirmed cases and 20 in probable cases, yielding a 27% case-fatality rate in confirmed cases. In 2019 in Nigeria, 810 confirmed cases were reported, and among those 167 died -- yielding a case-fatality rate of 20.6% that year.

Clinical Studies

In May 2019, we dosed our first patient in our Phase 1, first-in-human clinical trial to evaluate INO-4500, a DNA candidate vaccine to prevent infection from the Lassa virus. In 2019, we fully enrolled 60 volunteers in this placebo controlled, blinded, dose escalation study evaluating INO-4500 for safety, tolerability and immune responses. This trial represents the first Lassa candidate vaccine to enter the clinic. Our sponsored trial, as well as our INO-4500 program, is fully funded through the global partnership with CEPI that we entered into in April 2018.

If the results of this study are positive, we expect to advance INO-4500 into both Phase 1b and Phase 2 field trials in endemic countries of West Africa. If satisfactory Phase 2 data are achieved, CEPI, in cooperation with local regulatory authorities and the WHO, could be able to stockpile the vaccine for future use throughout the region.

COVID-19 (Coronavirus Disease 2019), Caused by the SARS-CoV-2 Virus

Overview

A novel Coronavirus emerged in the human population in Wuhan City, China in November-December 2019. On December 31, 2019 the WHO China Office was informed of a number of pneumonia cases of unknown etiology appearing in the previous few days in Wuhan, China. On January 8, 2020, Chinese scientists announced the identification of a new Coronavirus associated with this pneumonia outbreak, and on January 11, they publically shared the genetic sequence of that new virus. The new virus was temporarily referred to as “2019-nCoV” and “2019 novel coronavirus,” among other names, but subsequently was named SARS-CoV-2 due to the large similarity of its genetic sequence with that of the original severe acute respiratory syndrome coronavirus (SARS coronavirus or SARS-CoV). The new virus is a member of the genus of Coronaviruses, which is comprised of seven known viruses that can infect and make humans ill, including Middle East Respiratory Syndrome Coronavirus (MERS-CoV) and Severe Acute Respiratory Syndrome Coronavirus (SARS-CoV). This novel coronavirus is part of the Coronaviridae family of viruses that include the high risk viruses MERS-CoV and SARS-CoV, and four other lower risk coronaviruses which can cause the common cold. The disease caused by the SARS-CoV-2 novel coronavirus was subsequently named “COVID-19” (coronavirus disease, 2019).

Since the emergence of this novel virus, the virus has quickly spread throughout China and on to many other countries. As of February 28, 2020, a total of 53 countries/areas had reported at least one confirmed case, with at least one case from all continents of the world except for Antarctica. A total of 83,694 confirmed cases had been reported by that date worldwide to the WHO, with a total of 2,861 deaths reported of the confirmed cases. Also as of that date, about 94% of the cases cumulatively were reported from mainland China, but the nearly 4,900 cases had been reported from other countries/areas including the United States (59 cases), Japan, South Korea, several countries in Europe including Germany, France, the UK, and Spain, India, several countries in the Middle East, Australia, three countries in Africa including Egypt and Nigeria, and Brazil. In several of the countries outside of mainland China, as of that date very rapid spread and a high case count have occurred including in South Korea (2,337 cases), Japan (about 900 cases including on land and a cruise ship), Italy (650 cases), and Iran (245 cases). During this emergence, the WHO declared a Public Health Emergency of International Concern (PHEIC) and the U.S. declared a Public Health Emergency.

The preliminary data on the case fatality for COVID-19 indicate it is about 3.8%, which is significantly lower than that of SARS (10%) and MERS (about 34%), but significantly higher than for seasonal influenza (0.1%). Preliminary estimates of the reproductive number (R_0), or the average number of persons one infected person in turn infects, of SARS-CoV-2 range from 2.2 to somewhat above 4.0, with an average of about 3.8. The R_0 for this novel coronavirus thus appears to be significantly higher than that of MERS-CoV (< 1.0) and SARS-CoV (about 2.0). It is the combination of the significant R_0 and significant case fatality rate that makes this new coronavirus and disease a very significant, acute international threat. On February 28, 2020 the WHO raised its risk assessment level for spread and impact to “very high at a global level” - the highest such level the WHO declares for an infectious disease.

Preclinical Development

In January 2020, CEPI awarded us a grant of up to \$9 million to develop a vaccine against SARS-CoV-2/COVID-19. We anticipate this initial CEPI funding will support our preclinical and clinical development through Phase 1 human testing in the United States of INO-4800, our new coronavirus vaccine candidate matched to the outbreak strain.

We are also collaborating with Beijing Advaccine Biotechnology Co. to advance the development of INO-4800 in China. The goal of this collaboration is to leverage Beijing Advaccine's expertise to run a Phase 1 trial in China in parallel with our clinical development efforts in the United States. We will also work with Beijing Advaccine to attract additional grant funding and further collaborations with larger vaccine companies in China to increase the speed of future testing of INO-4800.

We believe we may be in a position to begin human clinical trials in the United States in April 2020, subject to approval from the FDA, and soon thereafter in China and South Korea subject to approval of applicable regulatory authorities. Our goal is to produce up to one million doses of a potential vaccine by the end of 2020, with our existing capacity and contract resources, for further clinical trials or emergency use.

Other Development Candidates

INO-1400 for the Treatment of Multiple Solid Tumor Types (hTERT antigen)

Human telomerase reverse transcriptase (hTERT) is a significant cancer immunotherapy target. High levels of hTERT have been detected in more than 85% of all human cancers, including breast, lung, and pancreatic cancers, while normal cells showed undetectable levels of telomerase expression. Immunological analysis indicated that hTERT is a widely applicable target recognized by T-cells and can be potentially used as a universal cancer immunotherapy. In 2020, over 565,000 new cases of breast, lung, or pancreatic cancers are estimated to collectively occur in the United States and about 225,000 people are estimated to die from these cancers collectively. Worldwide in 2018, more than 4.6 million new cases of these cancers occurred and more than 2.8 million people died from these cancers collectively. Despite available treatments, mortality rates remain unacceptably high in these tumor types. In addition, many existing treatment modalities are associated with significant adverse events.

In December 2014, we initiated a Phase 1 clinical trial of INO-1400 alone or in combination with INO-9012 in adults with breast, lung or pancreatic cancer at high risk of relapse after surgery and other cancer treatments. This open label, dose escalation study is evaluating the safety, tolerability, and immunogenicity of INO-1400, as well as another hTERT construct called INO-1401. To date, we have treated 90 patients with nine different types of solid tumors. All patients received treatment using our CELLECTRA[®] delivery device.

In November 2017, in poster presentations at the SITC Annual Meeting, we reported additional results from the ongoing Phase 1 trial in which that INO-1400 generated hTERT-specific IFN-gamma secreting T cells, suggesting an ability to break immune tolerance.

INO-1800 for the Treatment of Hepatitis B Virus

Although an effective preventive vaccine against hepatitis B virus, or HBV, infection has existed for over three decades, HBV remains a major epidemic, especially among people of Asian and African descent. The World Health Organization estimates that 2 billion people globally are or have been infected with HBV, with over 257 million people chronically infected with the virus and at risk of developing the major complications of cirrhosis or liver cancer. It is estimated that over two million people in the United States are chronically infected with the virus, including those who were foreign-born. Currently, the only therapies available for chronically infected individuals are interferon-alpha and nucleoside analog treatments, which function by controlling viral replication, but they do not clear infection. Interferon can prevent viral replication in only 30% of patients and does so with undesirable side effects.

Liver cancer is the fourth most common cause of death from cancer worldwide, and it kills the vast majority of patients within five years of diagnosis in the U.S. An estimated more than 841,000 new cases arose in 2018 worldwide. Liver cancer is estimated to have 42,810 new cases and kill more than 30,000 persons in the U.S. in 2020. One of the major causes and risk factors for liver cancer is infection by hepatitis B. Chronically infected individuals may develop a permanent scarring of the liver, a condition called cirrhosis. Liver cirrhosis can evolve into hepatocellular carcinoma, which claimed an estimated 780,000 lives worldwide in 2018.

INO-1800 is encoded for the HBcAg antigen and represents a consensus of the unique HBcAg DNA sequences of all major HBV genotypes (A through E). When delivered by CELLECTRA[®], in a preclinical study, INO-1800 elicited strong HBcAg-specific T cell and antibody responses in the periphery (outside of the liver) as measured by ELISpot, ICS and cell proliferation assays. Researchers observed that the immunization could also induce antigen-specific CD8+ and CD4+ T cells that produced both IFN- γ and TNF- α in the liver, indicating that a strong immunotherapy-induced T cell response was also present in the liver.

In the preclinical study, the antigen-specific T cells exhibited a killing function and were able to migrate to and stay in the liver and cause clearance of target cells without any evidence of liver injury. This was the first study to provide evidence that intramuscular immunization could induce killer T cells that can migrate to the liver and eliminate target cells.

In April 2015, we initiated a Phase 1 trial to evaluate INO-1800 in patients chronically infected with HBV. This randomized, open-label, active-controlled, dose escalation study was designed to evaluate the safety, tolerability and immunogenicity of INO-1800 alone or in combination with INO-9012. This international study enrolled patients in the United States and Asia Pacific region with a primary endpoint of safety and tolerability of the therapy. Secondary endpoints are evaluating the cellular and humoral immune response to INO-1800 and its effect on several viral and antiviral parameters. All trial subjects are also medicated with standard-of-care antiviral therapies.

In March 2018, we announced interim results from the trial, in which INO-1800 was well-tolerated and generated virus-specific T cells, including CD8+ killer T cells, meeting the objectives of the clinical study. Preliminary immunology data from the trial revealed that treatment of patients with INO-1800 resulted in the generation of T cells that recognized key components of the hepatitis B virus and reacted by making antiviral cytokines such as Interferon gamma, a protein believed to be linked to clearance of HBV from the liver. In the trial, INO-1800 was also able to activate and expand CD8+ killer T cells that displayed markers believed to be important for retention in the liver as well as multiple potential mechanisms for killing virally infected cells.

We are currently seeking a collaboration partner in order to further advance the clinical development of INO-1800.

INO-8000 (GLS-6150) for the Treatment of Hepatitis C Virus

Hepatitis C virus can cause both acute and chronic infection, ranging in severity from mild, short-term illness to a serious lifelong illness. This virus can cause liver cancer, for which annual incidence and mortality rates are provided above. Worldwide, an estimated 71 million persons have chronic hepatitis C infection, and a significant portion of those persons will develop liver cirrhosis or liver cancer. It is estimated that nearly 400,000 people died worldwide in year 2016 alone from hepatitis C.

Antiviral medications can cure most persons with this infection, but access to such treatment worldwide is low. Unfortunately, no effective vaccine exists for hepatitis C.

In September 2018, we announced the dosing of the first patient in a Phase 1 study designed to evaluate a preventive vaccine candidate, GLS-6150, against hepatitis C infection. Recruitment has begun in South Korea, where our collaborator GeneOne is responsible for conducting and funding this Phase 1 trial to assess the ability of GLS-6150 to boost immunity in people who have been treated and cleared of the virus. We believe that the vaccine could potentially be employed to prevent infection and re-infection.

This jointly developed, open-label, Phase 1 study of GLS-6150 will evaluate a total of 24 patients who have a sustained virologic response (SVR) following treatment for Hepatitis C (n=8 per group) and an additional 8 healthy controls to compare immune responses. Subjects will receive one of two doses of vaccine, 1 or 2 mg, administered intra-dermally and followed by electroporation with our CELLECTRA[®]-3P delivery device. Vaccinations will occur as a three-dose priming series (at 0, 4, 12 weeks) or as a two-dose priming series (at 0 and 8 weeks) and followed by a booster dose at 6 months. The final study visit is 4 weeks following the 6-month booster vaccination.

Universal Influenza Immunotherapy

Conventional vaccines are strain-specific and have limited ability to protect against genetic shifts in the influenza strains they target. They are therefore modified annually in anticipation of the next flu season's new strain(s). If a significantly different, unanticipated new strain emerges, such as the 2009 swine-origin pandemic strain, then the current vaccines provide little or no protective capability. In contrast, we believe that our design approach to characterize a broad consensus of antigens across variant strains of each influenza sub-type creates the ability to protect against new strains that have common genetic roots, even though they are not perfectly matched. By formulating a single immunotherapy with some or all of the key sub-types, protection may be achieved against seasonal as well as pandemic strains such as swine flu or pandemic-potential strains, such as avian influenza. We are focused on developing DNA-based influenza immunotherapies able to provide broad protection against known as well as newly emerging, unknown seasonal and pandemic influenza strains.

Instead of targeting a specific strain or strains, we have developed a universal vaccine strategy to deal with ever-changing flu threats. Using our SynCon[®] process, our scientists have designed immunotherapies targeting an optimal consensus of HA, NA, and NP proteins derived from multiple strains of each of the Type A sub-types H1N1, H2N2, H3N2 (these three influenza sub-types having been responsible for the majority of seasonal and pandemic influenza outbreaks in humans during the last century), as well as H5N1. In theory, consensus HA vaccine constructs from each sub-type, delivered using our CELLECTRA[®] device, could potentially protect immunized subjects from 90-95% of all human seasonal and pandemic influenza concerns. Additionally, we have also developed an optimal consensus of HA sequences derived from influenza Type B strains. Type B is one of three components of current seasonal influenza vaccinations. Using our SynCon[®] constructs, we have now developed immunotherapy elements that can target both pandemic-risk (H5N1, H7N9, H1N1) as well as seasonal influenza strains (H3N2, H1N1, influenza B).

Moreover, using our approach the immunotherapies might not have to be administered annually after the first few priming sessions. Rather, the same combination could be used to boost the immune system every few years.

In January 2018, we announced results from a preclinical study in which our synthetic vaccine approach, using a collection of synthetic DNA antigens, generated broad protective antibody responses against all major deadly strains of H1 influenza viruses from the last 100 years, including the virus that caused "Spanish Flu" in 1918 in multiple animal models, including mice, guinea pigs and non-human primates. The vaccine also protected 100% of immunized ferrets from a lethal virus challenge. The preclinical results were detailed in a paper published in the journal *Vaccine* entitled, "Broad cross-protective anti-hemagglutination responses elicited by influenza microconsensus DNA vaccine."

We are seeking additional grant and/or collaboration funding to further advance this program.

Immunotherapies for Biodefense and Biosecurity

A number of infectious agents that are relatively rare today are poised for an upsurge in incidence by either “natural” or terrorism-related means. For example, natural threats are posed by the influenza strains H5N1 and H7N9. At the same time, an engineered influenza virus for intentional release would pose a significant human threat.

Since 2001, the United States government has spent or allocated over a billion dollars in funding to address the threat of biological weapons. United States funding for bioweapons-related activities focuses primarily on research for and acquisition of medicines for defense. Biodefense funding also goes toward stockpiling protective equipment, increased surveillance and detection of biological agents, and improving state and hospital preparedness. The increase in this type of funding is mainly due to the Project BioShield Act adopted in 2004.

There are opportunities to secure development funding and for proof-of principle immunotherapy studies for bio-warfare pathogens. We have secured funding from the U.S. government for these projects.

We continue to actively pursue grant and contract funding from the NIH, Department of Defense and other government funding agencies as a source of non-dilutive funding to support development of specific technologies that are broadly applicable across multiple product development programs in the areas of cancer, infectious diseases and biodefense. Based on various initiatives and with the support of NIH funding we are an active collaborator with the Department of Defense (U.S. Army) and continue research and development of DNA-based immunotherapies delivered via our proprietary CELLECTRA® delivery system. Specifically, our projects are focused on identifying immunotherapy candidates with the potential to provide rapid, robust immunity to protect against bio-warfare and bioterror attacks as well as development of our CELLECTRA® devices.

In October 2014, DARPA awarded \$12.2 million to our scientists and those from the Perelman School of Medicine at the University of Pennsylvania and AstraZeneca to develop and assess dMAb products for influenza and antibiotic resistant bacteria in preclinical studies. This collaboration aims to demonstrate that DNA plasmids can activate sufficient quantities of disease-specific monoclonal antibodies in the body to be protective against a pathogen challenge. See the section below titled “Synthetic DNA-based Monoclonal Antibodies” for more details on our dMAb programs.

Synthetic DNA-based Monoclonal Antibodies Program

mAbs have become one of the most valuable therapeutic technologies of recent years. In 2012, global sales of mAbs exceeded \$50 billion. Among the top 10 best-selling drugs in 2012, six were monoclonal antibodies, each with annual sales exceeding \$5 billion.

mAbs are designed to enhance the immune system's ability to regulate cell functions. They are designed to bind to a very specific epitope (area) of an antigen or cell surface target and can bind to almost any selected target. They have the ability to alert the immune system to attack and kill specific cancer cells (as in the case of Yervoy®) or block certain biochemical pathways (such as those leading to rheumatoid arthritis, as in the case of Humira®). However, mAb technology has limitations. As a passive immunotherapy, meaning they are manufactured outside the body, mAbs require costly large-scale laboratory development and production. Additional limitations include high cost to develop and manufacture, their limited duration of *in vivo* potency, and a pharmacokinetic profile that can result in toxicity. We have created DNA based monoclonal antibodies that we believe overcome many of the limitations associated with conventional mAb technology.

Using our core platform technology, we encode the DNA sequence for a specific monoclonal antibody in a DNA plasmid. We deliver the plasmid directly into cells of the body using CELLECTRA®, enabling these cells to manufacture the mAbs *in vivo*, - unlike conventional mAb technology that requires manufacture outside of the body. We believe this approach provides potentially significant advantages in terms of lower production costs, as well as the ability to target a pharmacokinetic profile that provides control in terms of dosing regimen, peak responses, duration of responses and toxicity.

We expect to design dMAb product candidates not only for new disease targets not currently addressable with conventional mAbs, but also targets of existing, commercially available mAb products. We have already designed and produced dMAb product candidates targeting cancer mechanisms including checkpoint inhibition, anti-cancer pathways and anti-Tregs, as well as prophylactic and therapeutic dMAb product candidates for infectious diseases including Ebola, influenza, antibiotic resistant bacteria, dengue and Chikungunya. When the mAb binds to an infectious disease receptor, the immune system then generates natural killer cells and macrophages to clear the virus or bacteria-bound mAbs.

Proof of Concept

Our first published research on a DNA-based monoclonal antibody was presented in October 2013 in *Human Vaccines & Immunotherapeutics* in a paper entitled, “Optimized and enhanced DNA plasmid vector based *in vivo* construction of a neutralizing anti-HIV-1 envelope glycoprotein Fab.” In a preclinical study, a single administration in mice of a highly optimized dMAb® HIV immunotherapy generated antibody molecules in the bloodstream that possessed desirable functional activity, including high antigen-binding and HIV-neutralization capabilities, against diverse strains

of HIV viruses. In the study, this delivery strategy resulted in an increase in Fab levels in as little as 48 hours, when compared with protein-based immunization.

A second paper was published in July 2015 in *Scientific Reports*, a Nature Publishing Group journal, in the paper, "Protection against dengue disease by synthetic nucleic acid antibody prophylaxis/immunotherapy." In this study, a single intramuscular injection of a DNA plasmid encoding a monoclonal antibody targeting dengue protected mice subsequently exposed to the dengue virus. The protection conferred by the monoclonal antibodies expressed by these dMAb product candidates was very rapid, with 100% survival in mice challenged with lethal enhanced dengue disease less than a week after dMAb administration. While conventional vaccine and monoclonal antibody technologies have shown limited ability to provide an effective solution to dengue to date, the unique attributes and data generated by dMAb immunotherapies show their potential to provide a needed solution. Furthermore, this short time frame to achieve full protection is significantly more rapid than vaccine-driven protection, which can take weeks to months to reach peak efficacy levels.

A paper published in March 2016 in *The Journal of Infectious Diseases* entitled, "Rapid and long-term immunity elicited by DNA encoded antibody prophylaxis and DNA vaccination against Chikungunya virus," discussed the results of our preclinical study in which animals transfected with our DNA-based mAb targeting Chikungunya virus (CHIKV) exhibited the specific ability to bind to the CHIKV envelope antigen, and this serum possessed CHIKV-neutralizing activity. CHIKV is a serious mosquito-borne alpha-virus responsible for several recent epidemics in tropical Africa and Asia. In mid-2015, the CDC reported that suspected or confirmed cases of Chikungunya had reached 1.74 million in 45 countries or territories in the Americas. There is currently no vaccine or therapeutic against this virus. In the study, the treatment of the animals with anti-CHIKV mAb plasmids protected 100% of the treated animals from a lethal injection of CHIKV virus while 100% of the control animals died. The treated animals were also spared virus-related morbidity, as measured by dramatic weight loss and lethargy.

Next Steps

In October 2014, DARPA awarded a \$12.2 million grant to our scientists and those from the Perelman School of Medicine at the University of Pennsylvania and AstraZeneca in order to develop and assess dMAb product candidates in preclinical studies.

This collaboration aims to demonstrate that DNA plasmids can activate sufficient quantities of disease-specific monoclonal antibodies in the body to be protective against a pathogen challenge. Using the capabilities and advantages of DNA plasmids delivered using CELLECTRA[®], the team is constructing and evaluating multiple dMAb product candidates focused on influenza virus and antibiotic resistant bacteria, such as *Pseudomonas aeruginosa* and *Staphylococcus aureus*.

In 2016, we expanded the collaboration to include The Wistar Institute after the collaborating investigator, Dr. David Weiner, a member of our board of directors, moved to the Institute.

Depending on the outcome of the preclinical studies, we and our collaborators may seek to advance a dMAb product candidate into clinical trials, if we are able to obtain additional governmental or non-governmental funding to do so.

As described above, in April 2015, we received a grant from DARPA to lead a consortium to develop multiple treatment and prevention approaches against Ebola. The aim of the research funded by this grant is to compare combinations of a DNA vaccine with conventional or DNA-based monoclonal antibodies.

In July 2016, we announced that our DNA-based monoclonal antibody technology will be deployed to develop product candidates which could be used alone and in combination with other immunotherapies in the pursuit of new ways to treat and potentially cure infection from HIV. Funding for this research is part of a \$23 million grant from the National Institutes of Health to our collaborator, The Wistar Institute.

As described above, we have also received a sub-grant through The Wistar Institute to develop a DNA-based monoclonal antibody designed to provide a fast-acting treatment against Zika infection and its debilitating effects.

In February 2019, we announced that in collaboration with The Wistar Institute and the University of Pennsylvania, the first subject was dosed as part of the first-ever human study of our dMAb technology. Funded fully by the Bill & Melinda Gates Foundation, this trial's focus is on evaluating our dMAb's ability to prevent or treat Zika virus infection. This open-label trial is a single center, dose escalation trial that will enroll up to 24 healthy volunteers who will receive up to four doses of dMAbs.

License, Collaboration, Supply and Other Agreements

We have entered into various arrangements with corporate, academic, and government collaborators, licensors, licensees and others. These arrangements are summarized below.

AstraZeneca

In August 2015, we entered into a strategic cancer vaccine collaboration and license agreement with AstraZeneca. Under the agreement, AstraZeneca acquired exclusive rights to our immunotherapy candidate INO-3112 (renamed MEDI0457), which targets cancers caused by human papillomavirus (HPV) types 16 and 18.

Under the terms of the agreement, AstraZeneca made an upfront payment of \$27.5 million to us in the third quarter of 2015. AstraZeneca will fund all development costs. The agreement also calls for potential future payments totaling up to \$700 million upon reaching specified development and commercial milestones. We are entitled to receive up to double-digit tiered royalties on MEDI0457 product sales.

AstraZeneca is studying MEDI0457 in combination with its PD-L1 checkpoint inhibitor, durvalumab, in a Phase 1/2 clinical trial in patients with recurrent or metastatic head and neck squamous cancer associated with HPV. On December 28, 2017, we received a \$7.0 million milestone payment from AstraZeneca, which was triggered by the initiation of the Phase 2 portion of this ongoing clinical trial. In December 2018, we received a \$2.0 million milestone payment upon the dosing of the first cervical cancer patient in the trial. In January 2019, we received a \$2.0 million milestone payment upon the initiation of a Phase 2 combination trial to evaluate MEDI0457 in combination with durvalumab targeting a broad array of cancers associated with HPV.

GeneOne

In September 2014, we and GeneOne announced a collaboration in which the companies will co-develop our DNA-based Ebola vaccine through a Phase 1 clinical trial. In April 2015, the collaborators received an award from DARPA to further advance the Ebola project. The previous collaboration agreement with GeneOne for Ebola vaccine was incorporated into this consortium funded by DARPA. In May 2015, a Phase 1 study of the DNA vaccine part of the project was initiated. Enrollment of this study has been completed. Details of this project are provided under "Ebola" above.

In May 2015, we announced that we will advance a DNA vaccine for MERS into a Phase 1 clinical trial in healthy volunteers in a collaboration with GeneOne. Under the terms of the agreement, GeneOne will be responsible for funding all preclinical and clinical studies through Phase 1. In return, GeneOne will receive up to a 35% milestone-based ownership interest in the MERS immunotherapy upon achievement of the last milestone event of completion of the Phase 1 safety and immunogenicity study. In January 2016, the collaborators announced the initiation of recruitment for the Phase 1 study in partnership with the Walter Reed Army Institute of Research (WRAIR) in Maryland, where the trial was conducted. We announced results from the trial in June 2018.

In January 2016, we and GeneOne expanded the collaboration agreement to test and advance our DNA-based vaccine for preventing and treating Zika virus.

ApolloBio

In December 2017, we entered into an Amended and Restated License and Collaboration Agreement with Beijing Apollo Saturn Biological Technology Limited, a corporation organized under the laws of China, or ApolloBio. Under the terms of this License and Collaboration Agreement, which became effective in March 2018, we granted to ApolloBio the exclusive right to develop and commercialize VGX-3100, our DNA immunotherapy product candidate designed to treat pre-cancers caused by HPV, within the territories of China, Hong Kong, Macao and Taiwan. The territory may be expanded to include Korea in the event that no patent covering VGX-3100 issues in China within the first three years of the term of the agreement.

As part of the License and Collaboration Agreement, we have granted to ApolloBio an option to negotiate an exclusive license to research, develop and commercialize MEDI0457 in the event of termination of our current collaboration with AstraZeneca for the development of MEDI0457 in the territory covered by the License and Collaboration Agreement. As part of the collaboration, ApolloBio will fund all clinical development costs within the licensed territory, and the parties will discuss in good faith the inclusion of clinical trial sites in China as part of our ongoing Phase 3 clinical development program for VGX-3100.

Under the License and Collaboration Agreement, we received proceeds of \$19.4 million in March 2018, which comprised an upfront payment of \$23.0 million less \$2.2 million in foreign income taxes and \$1.4 million in certain foreign non-income taxes. The foreign income taxes were recorded as a provision for income taxes and the foreign non-income taxes were recorded as a general and administrative expense, on the consolidated statement of operations during the year ended December 31, 2018.

In addition to the upfront payment, we are entitled to receive up to an aggregate of \$20.0 million, less required income, withholding or other taxes, upon the achievement of specified milestones related to the regulatory approval of VGX-3100 in the United States, China and Korea. In the event that VGX-3100 is approved for marketing in these territories, we will be entitled to receive royalty payments based on a tiered percentage of annual net sales, with such

percentage being in the low- to mid-teens, subject to reduction in the event of generic competition in a particular territory. ApolloBio's obligation to pay royalties will continue for 10 years after the first commercial sale in a particular territory or, if later, until the expiration of the last-to-expire patent covering the licensed products in the specified territory. The License and Collaboration Agreement, once effective, will continue in force until ApolloBio has no remaining royalty obligations.

Agreements Focused on Advancing Immuno-Oncology

In May 2017, we entered into a supply agreement with Genentech to obtain supply of TECENTRIQ® (atezolizumab) for use in our clinical trials evaluating INO-5401 and INO-9012, an immune activator encoding IL-12, in combination with TECENTRIQ®, in approximately 80 patients with advanced bladder cancer. We will manage and fund the costs of the multi-center, open-label trial.

In May 2017, we entered into a clinical study and supply agreement with Regeneron to provide its PD-1 inhibitor, REGN2810, for use in our clinical trials evaluating INO-5401 and INO-9012, in combination with REGN2810, in patients with newly diagnosed GBM. Under the terms of the agreement, we will conduct and fund the trial based upon a mutually agreed upon study design.

In January 2018, we entered into a Clinical Collaboration Agreement with the PICI to undertake clinical evaluation of novel combination regimens within the field of immuno-oncology. We expect to benefit from the PICI's innovative research model, which brings together leading academic cancer institutions and companies to share resources, data and technology, accelerate research through unifying and managing clinical trial design, and conduct multi-center clinical trials. The goal of our collaboration is to design studies that have the potential to address cancers with high unmet need. The initial trial under consideration would address muscle-invasive bladder cancer with INO-5401 in combination with other immunotherapies.

Under the agreement, the PICI will have responsibility for clinical study execution, working in collaboration with its established network of clinical academic and industry cancer centers. We will contribute a portion of the development costs in an amount to be determined if the product candidate studied under the collaboration reaches the initiation of a Phase 3 clinical trial.

Geneos Therapeutics

In August 2016, we incorporated a subsidiary, Geneos Therapeutics, Inc., to develop and commercialize neoantigen based personalized cancer therapies. As of December 31, 2018, we owned 100% of the outstanding equity of Geneos. In February 2019, Geneos raised capital from the issuance of equity to us and other third parties, which reduced our ownership percentage. While we leverage our SynCon® immunotherapy and CELLECTRA® delivery technologies to break tolerance and create cancer products targeting shared tumor specific antigens, Geneos is focusing exclusively on leveraging our immunotherapy technology platform to advance the field of patient-specific neoantigen therapies for cancer. We believe that our clinically validated DNA-based platform is well suited for advancing individualized therapies due to its rapid product design and manufacturing benefits, ability to combine multiple neoantigens into formulations, and generation of potent killer T cell responses that are needed to drive clinical efficacy. We have exclusively licensed our SynCon® immunotherapy and CELLECTRA® technology platform to Geneos to be used in the field of personalized, neoantigen based therapy for cancer. The license agreement provides for potential royalty payments to us in the event that Geneos commercializes any products using the licensed technology.

Core DNA Immunotherapy Technology and Product License

In March 2016, we entered into a collaborative research agreement with the Wistar Institute for preventive and therapeutic DNA-based immunotherapy applications and products for cancers and infectious diseases developed by David B. Weiner, Ph.D., and his Wistar laboratory. We will have the exclusive right to in-license new intellectual property developed in this collaboration. In January 2020, we signed a license agreement with the Wistar Institute, attaining exclusive worldwide rights to develop multiple DNA plasmids and constructs with the potential to treat and/or prevent cancer and infectious diseases.

We also have license agreements for intellectual property relating to DNA-based immunotherapy technology and multiple products developed at the University of Pennsylvania, or UPenn. Under the terms of the license agreement with UPenn, we have obtained exclusive worldwide rights to develop multiple DNA plasmids and constructs with the potential to treat and/or prevent cancer and infectious diseases.

Both Wistar and UPenn license agreements, as amended to date, provide for royalty payments, based on future sales of licensed products.

Competition

As we develop and seek to ultimately commercialize our product candidates, we face and will continue to encounter competition with an array of existing or development-stage drug and immunotherapy approaches targeting diseases we are pursuing. We are aware of various established enterprises, including major pharmaceutical companies, broadly engaged in vaccine/immunotherapy research and development. These include Janssen Pharmaceuticals (part of J&J), Sanofi-Aventis, GlaxoSmithKline plc, Merck, Pfizer, and our collaborator AstraZeneca. There are also various development-stage biotechnology companies involved in different vaccine and immunotherapy technologies including Aduro Biotech, Advaxis, Bavarian Nordic, BioNTech, CureVac, Dynavax, Hookipa, Iovance, Moderna, Nektar, Novavax, Translate Bio and Vir Biotechnology. If these companies are successful in developing their technologies, it could materially and adversely affect our business and our future growth prospects.

Merck and GlaxoSmithKline have commercialized preventive vaccines against HPV to protect against cervical cancer. Some companies are seeking to treat early HPV infections or low grade cervical dysplasias. Loop Electrosurgical Excision Procedure, commonly known as LEEP, is the current standard of care for treating high-grade cervical dysplasia. Advaxis and Gilead Sciences have therapeutic cervical cancer product candidates under development. Many companies are pursuing different approaches to GBM, prostate, breast, lung and other cancers we are targeting.

We also compete more specifically with companies seeking to utilize antigen-encoding DNA delivered with electroporation or other DNA delivery technologies such as viral vectors or lipid vectors to induce *in vivo* generated antigen production and immune responses to prevent or treat various diseases. These competitive technologies have shown promise, but they each also have their unique obstacles to overcome.

Viral DNA Delivery

This technology utilizes a virus as a carrier to deliver genetic material into target cells. The method is efficient for delivering immunotherapy antigens and has the advantage of mimicking real viral infection so that the recipient will mount a broad immune response against the immunotherapy. The greatest limitation of the technology stems from problems with unwanted immune responses against the viral vector, limiting its use to patients who have not been previously exposed to the viral vector and making repeated administration difficult. In addition, complexity and safety concerns increase their cost and complicate regulatory approval.

Lipid DNA Delivery

A number of lipid formulations have been developed that increase the effect of DNA/RNA immunotherapies. These work by either increasing uptake of the DNA/RNA into cells or by acting as an adjuvant, alerting the immune system. While there has been progress in this field, lipid delivery tends to be less efficient than viral vectors and is hampered by concerns regarding toxicity and increased complexity.

DNA Immunotherapy Delivery with Electroporation

There are other companies with electroporation intellectual property and devices. We believe we have significant competitive advantages over other companies focused on electroporation for multiple reasons:

- We have an extensive history and experience in developing the methods and devices that optimize the use of electroporation in conjunction with DNA-based agents. This experience has been validated with multiple sets of interim data from multiple clinical studies assessing DNA-based immunotherapies and vaccines against cancers and infectious disease.
- We have a broad product line of electroporation instruments designed to enable DNA delivery in tumors, muscle, and skin.
- We have been proactive in filing for patents, as well as acquiring and licensing additional patents, to expand our global patent estate.

If any of our competitors develop products with efficacy or safety profiles significantly better than our product candidates, we may not be able to commercialize our products, and sales of any of our commercialized products could be harmed. Some of our competitors and potential competitors have substantially greater product development capabilities and financial, scientific, marketing and human resources than we do. Competitors may develop products earlier, obtain FDA approvals for products more rapidly, or develop products that are more effective than those under development by us. We will seek to expand our technological capabilities to remain competitive; however, research and development by others may render our technologies or products obsolete or noncompetitive, or result in treatments or cures superior to ours.

Our competitive position will be affected by the disease indications addressed by our product candidates and those of our competitors, the timing of market introduction for these products and the stage of development of other technologies to address these disease indications. For us and our competitors, proprietary technologies, the ability to complete clinical trials on a timely basis and with the desired results, and the ability to obtain timely regulatory

approvals to market these product candidates are likely to be significant competitive factors. Other important competitive factors will include the efficacy, safety, ease of use, reliability, availability and price of products and the ability to fund operations during the period between technological conception and commercial sales.

The FDA and other regulatory agencies may expand current requirements for public disclosure of DNA-based product development data, which may harm our competitive position with foreign and United States companies developing DNA-based products for similar indications.

Government Regulation

Government authorities in the United States at the federal, state and local level and in other countries extensively regulate, among other things, the research, development, testing, manufacture, quality control, approval, labeling, packaging, storage, record-keeping, promotion, advertising, distribution, post-approval monitoring and reporting, marketing and export and import of biological products, or biologics, and medical devices, such as our product candidates. Generally, before a new biologic or medical device can be marketed, considerable data demonstrating its quality, safety and efficacy must be obtained, organized into a format specific to each regulatory authority, submitted for review and approved by the regulatory authority.

Review and Approval of Combination Products in the United States

Certain products may be comprised of components that would normally be regulated under different types of regulatory authorities, and frequently by different centers at the FDA. These products are known as combination products. Specifically, under regulations issued by the FDA, a combination product may be:

- a product comprised of two or more regulated components that are physically, chemically, or otherwise combined or mixed and produced as a single entity;
- two or more separate products packaged together in a single package or as a unit and comprised of drug and device products;
- a drug, device, or biological product packaged separately that according to its investigational plan or proposed labeling is intended for use only with an approved individually specified drug, device or biological where both are required to achieve the intended use, indication, or effect and where upon approval of the proposed product the labeling of the approved product would need to be changed, e.g., to reflect a change in intended use, dosage form, strength, route of administration, or significant change in dose; or
- any investigational drug, device, or biological packaged separately that according to its proposed labeling is for use only with another individually specified investigational drug, device, or biological product where both are required to achieve the intended use, indication, or effect.

Our product candidates are combination products comprising an electroporation device for delivery of a biologic. Under the Federal Food, Drug, and Cosmetic Act, or FDCA, the FDA is charged with assigning a center with primary jurisdiction, or a lead center, for review of a combination product. That determination is based on the “primary mode of action” of the combination product, which means the mode of action expected to make the greatest contribution to the overall intended therapeutic effects. Thus, if the primary mode of action of a device-biologic combination product is attributable to the biologic product, that is, if it acts by means of a virus, therapeutic serum, toxin, antitoxin, vaccine, blood, blood component or derivative, allergenic product, or analogous product, the FDA center responsible for premarket review of the biologic product would have primary jurisdiction for the combination product. We believe that all of our product candidates will have a biologic primary mode of action, with the device component reviewed under a Device Master File.

U.S. Biological Product Development

In the United States, the FDA regulates biologics under FDCA, and the Public Health Service Act, or PHSA, and their implementing regulations. Biologics are also subject to other federal, state and local statutes and regulations. The process of obtaining regulatory approvals and the subsequent compliance with appropriate federal, state, local and foreign statutes and regulations require the expenditure of substantial time and financial resources. Failure to comply with the applicable U.S. requirements at any time during the product development process, approval process or after approval, may subject an applicant to administrative or judicial sanctions. These sanctions could include, among other actions, the FDA’s refusal to approve pending applications, withdrawal of an approval, a clinical hold, untitled or warning letters, product recalls or withdrawals from the market, product seizures, total or partial suspension of production or distribution injunctions, fines, refusals of government contracts, restitution, disgorgement, or civil or criminal penalties. Any agency or judicial enforcement action could have a material adverse effect on us.

Our product candidates must be approved by the FDA through the Biologics License Application, or BLA, process before they may be legally marketed in the United States. The process required by the FDA before a biologic may be marketed in the United States generally involves the following:

- completion of extensive nonclinical, sometimes referred to as pre-clinical laboratory tests, pre-clinical animal studies and formulation studies in accordance with applicable regulations, including the FDA's Good Laboratory Practice, or GLP, regulations;
- submission to the FDA of an IND, which must become effective before human clinical trials may begin;
- performance of adequate and well-controlled human clinical trials in accordance with applicable IND and other clinical trial-related regulations, sometimes referred to as good clinical practices, or GCPs, to establish the safety and efficacy of the proposed product candidate for its proposed indication;
- submission to the FDA of a BLA;
- satisfactory completion of an FDA pre-approval inspection of the manufacturing facility or facilities where the product is produced to assess compliance with the FDA's current good manufacturing practice, or cGMP, requirements to assure that the facilities, methods and controls are adequate to preserve the product's identity, strength, quality, purity and potency;
- potential FDA audit of the pre-clinical and/or clinical trial sites that generated the data in support of the BLA; and
- FDA review and approval of the BLA prior to any commercial marketing or sale of the product in the United States.

The data required to support a BLA is generated in two distinct development stages: pre-clinical and clinical. The pre-clinical development stage generally involves laboratory evaluations of drug chemistry, formulation and stability, as well as studies to evaluate toxicity in animals, which support subsequent clinical testing. The conduct of the pre-clinical studies must comply with federal regulations, including GLPs. The sponsor must submit the results of the pre-clinical studies, together with manufacturing information, analytical data, any available clinical data or literature and a proposed clinical protocol, to the FDA as part of the IND. An IND is a request for authorization from the FDA to administer an investigational drug product to humans. The central focus of an IND submission is on the general investigational plan and the protocol(s) for human trials. The IND automatically becomes effective 30 days after receipt by the FDA, unless the FDA raises concerns or questions regarding the proposed clinical trials and places the IND on clinical hold within that 30-day time period. In such a case, the IND sponsor and the FDA must resolve any outstanding concerns before the clinical trial can begin. The FDA may also impose clinical holds on a product candidate at any time before or during clinical trials due to safety concerns or non-compliance. Accordingly, we cannot be sure that submission of an IND will result in the FDA allowing clinical trials to begin, or that, once begun, issues will not arise that could cause the trial to be suspended or terminated.

The clinical stage of development involves the administration of the product candidate to healthy volunteers or patients under the supervision of qualified investigators, generally physicians not employed by or under the trial sponsor's control, in accordance with GCPs, which include the requirement that all research subjects provide their informed consent for their participation in any clinical trial. Clinical trials are conducted under protocols detailing, among other things, the objectives of the clinical trial, dosing procedures, subject selection and exclusion criteria, and the parameters to be used to monitor subject safety and assess efficacy. Each protocol, and any subsequent amendments to the protocol, must be submitted to the FDA as part of the IND. Further, each clinical trial must be reviewed and approved by an independent institutional review board, or IRB, at or servicing each institution at which the clinical trial will be conducted. An IRB is charged with protecting the welfare and rights of trial participants and considers such items as whether the risks to individuals participating in the clinical trials are minimized and are reasonable in relation to anticipated benefits. The IRB also approves the informed consent form that must be provided to each clinical trial subject or his or her legal representative and must monitor the clinical trial until completed.

There are also requirements governing the reporting of ongoing clinical trials and completed clinical trial results to public registries. Sponsors of certain clinical trials of FDA-regulated products, including biologics, are required to register and disclose specified clinical trial information, which is publicly available at www.clinicaltrials.gov. Information related to the product, patient population, phase of investigation, study sites and investigators, and other aspects of the clinical trial is then made public as part of the registration. Sponsors are also obligated to disclose the results of their clinical trials after completion.

Clinical trials are generally conducted in three sequential phases that may overlap, known as Phase 1, Phase 2 and Phase 3 clinical trials. Phase 1 clinical trials generally involve a small number of healthy volunteers who are initially exposed to a product candidate. The primary purpose of these clinical trials is to assess the action, side effect tolerability

and safety of the product candidate and, if possible, to gain early evidence on effectiveness. Phase 2 clinical trials typically involve studies in patients to determine the dose required to produce the desired benefits. At the same time, safety and preliminary evaluation of efficacy is assessed. Phase 3 clinical trials generally involve large numbers of patients at multiple sites, in multiple countries (from several hundred to several thousand subjects) and are designed to provide the data necessary to demonstrate the efficacy of the product for its intended use, its safety in use, and to establish the overall benefit/risk relationship of the product and provide an adequate basis for product approval. Phase 3 clinical trials may include comparisons with placebo and/or other comparator treatments. The duration of treatment is often extended to mimic the actual use of a product during marketing. Generally, two adequate and well-controlled Phase 3 clinical trials are required by the FDA for approval of a BLA.

Post-approval trials, sometimes referred to as Phase 4 clinical trials, may be conducted after initial marketing approval. These trials are used to gain additional experience from the treatment of patients in the intended therapeutic indication. In certain instances, FDA may condition approval of a BLA on the sponsor's agreement to conduct additional clinical trials to further assess the biologic's safety and effectiveness after BLA approval.

Progress reports detailing the results of the clinical trials must be submitted at least annually to the FDA and written IND safety reports must be submitted to the FDA and the investigators for serious and unexpected suspected adverse, findings from other studies suggesting a significant risk to humans exposed to the drug, findings from animal or *in vitro* testing suggesting a significant risk to humans, and any clinically important rate increase of a serious suspected adverse reaction over that listed in the protocol or investigator brochure. Phase 1, Phase 2 and Phase 3 clinical trials may not be completed successfully within any specified period, if at all. The FDA, the IRB, or the sponsor may suspend or terminate a clinical trial at any time on various grounds, including a finding that the research subjects or patients are being exposed to an unacceptable health risk. Similarly, an IRB can suspend or terminate approval of a clinical trial at its institution if the clinical trial is not being conducted in accordance with the IRB's requirements or if the drug has been associated with unexpected serious harm to patients. Additionally, some clinical trials are overseen by an independent group of qualified experts organized by the clinical trial sponsor, known as a data safety monitoring board or committee. This group provides authorization for whether or not a trial may move forward at designated intervals based on access to certain data from the trial. We may also suspend or terminate a clinical trial based on evolving business objectives and/or competitive climate. Concurrent with clinical trials, companies usually complete additional animal studies and must also develop additional information about the chemistry and physical characteristics of the product candidate as well as finalize a process for manufacturing the product in commercial quantities in accordance with cGMP requirements. The manufacturing process must be capable of consistently producing quality batches of the product candidate and, among other things, must develop methods for testing the identity, strength, quality and purity of the final product. Additionally, appropriate packaging must be selected and tested and stability studies must be conducted to demonstrate that the product candidate does not undergo unacceptable deterioration over its shelf life.

BLA and FDA Review Process

Following trial completion, trial data is analyzed to assess safety and efficacy. The results of pre-clinical studies and clinical trials are then submitted to the FDA as part of a BLA, along with proposed labeling for the product and information about the manufacturing process and facilities that will be used to ensure product quality, results of analytical testing conducted on the chemistry of the product candidate, and other relevant information. The BLA is a request for approval to market the biologic for one or more specified indications and must contain proof of safety, purity, potency and efficacy, which is demonstrated by extensive pre-clinical and clinical testing. The application includes positive findings from pre-clinical and clinical trials as well as ambiguous or negative results. Data may come from company-sponsored clinical trials intended to test the safety and efficacy of a use of a product, or from a number of alternative sources, including studies initiated by investigators. To support marketing approval, the data submitted must be sufficient in quality and quantity to establish the safety and efficacy of the investigational product to the satisfaction of the FDA.

Under the Prescription Drug User Fee Act, or PDUFA, as amended, each BLA must be accompanied by a significant user fee, which is adjusted on an annual basis. PDUFA also imposes an annual program fee for approved products. Fee waivers or reductions are available in certain circumstances, including a waiver of the application fee for the first application filed by a small business.

Once a BLA has been accepted for filing, which occurs, if at all, sixty days after the BLA's submission, the FDA's goal is to review BLAs within ten months of the filing date for standard review or six months of the filing date for priority review, if the application is for a product intended for a serious or life-threatening condition and the product, if approved, would provide a significant improvement in safety or effectiveness. The review process is often significantly extended by FDA requests for additional information or clarification. If not accepted for filing, the sponsor must resubmit the BLA and begin the FDA's review process again, including the initial sixty day review to determine if the application is sufficiently complete to permit substantive review.

After the BLA submission is accepted for filing, the FDA reviews the BLA to determine, among other things, whether the proposed product candidate is safe and effective for its intended use, and whether the product candidate is being manufactured in accordance with cGMP to assure and preserve the product candidate's identity, strength, quality, purity and potency. The FDA may refer applications for novel drug product candidates or drug product candidates which present difficult questions of safety or efficacy to an advisory committee, typically a panel that includes clinicians and other experts, for review, evaluation and a recommendation as to whether the application should be approved and under what conditions. The FDA is not bound by the recommendations of an advisory committee, but it considers such recommendations carefully when making decisions. The FDA will likely re-analyze the clinical trial data, which could result in extensive discussions between the FDA and us during the review process. The review and evaluation of a BLA by the FDA is extensive and time consuming and may take longer than originally planned to complete, and we may not receive a timely approval, if at all.

Before approving a BLA, the FDA will conduct a pre-approval inspection of the manufacturing facilities for the new product to determine whether they comply with cGMPs. The FDA will not approve the product unless it determines that the manufacturing processes and facilities are in compliance with cGMP requirements and adequate to assure consistent production of the product within required specifications. In addition, before approving a BLA, the FDA may also audit data from clinical trials to ensure compliance with GCP requirements. After the FDA evaluates the application, manufacturing process and manufacturing facilities, it may issue an approval letter or a Complete Response Letter. An approval letter authorizes commercial marketing of the product with specific prescribing information for specific indications. A Complete Response Letter indicates that the review cycle of the application is complete and the application will not be approved in its present form. A Complete Response Letter usually describes all of the specific deficiencies in the BLA identified by the FDA. The Complete Response Letter may require additional clinical data and/or an additional pivotal Phase 3 clinical trial(s), and/or other significant and time-consuming requirements related to clinical trials, pre-clinical studies or manufacturing. If a Complete Response Letter is issued, the applicant may either resubmit the BLA, addressing all of the deficiencies identified in the letter, or withdraw the application. Even if such data and information is submitted, the FDA may ultimately decide that the BLA does not satisfy the criteria for approval. Data obtained from clinical trials are not always conclusive and the FDA may interpret data differently than we interpret the same data.

There is no assurance that the FDA will ultimately approve a product for marketing in the United States and we may encounter significant difficulties or costs during the review process. If a product receives marketing approval, the approval may be significantly limited to specific populations, severities of allergies, and dosages or the indications for use may otherwise be limited, which could restrict the commercial value of the product. Further, the FDA may require that certain contraindications, warnings or precautions be included in the product labeling or may condition the approval of the BLA on other changes to the proposed labeling, development of adequate controls and specifications, or a commitment to conduct post-market testing or clinical trials and surveillance to monitor the effects of approved products. For example, the FDA may require Phase 4 testing which involves clinical trials designed to further assess the product's safety and effectiveness and may require testing and surveillance programs to monitor the safety of approved products that have been commercialized. The FDA may also place other conditions on approvals including the requirement for a Risk Evaluation and Mitigation Strategy, or REMS, to assure the safe use of the product. If the FDA concludes a REMS is needed, the sponsor of the BLA must submit a proposed REMS. The FDA will not approve the BLA without an approved REMS, if required. A REMS could include medication guides, physician communication plans, or elements to assure safe use, such as restricted distribution methods, patient registries and other risk minimization tools. Any of these limitations on approval or marketing could restrict the commercial promotion, distribution, prescription or dispensing of products. Product approvals may be withdrawn for non-compliance with regulatory standards or if problems occur following initial marketing.

Post-Marketing Requirements

Following approval of a new product, a manufacturer and the approved product are subject to continuing regulation by the FDA, including, among other things, monitoring and recordkeeping activities, reporting to the applicable regulatory authorities of adverse experiences with the product, providing the regulatory authorities with updated safety and efficacy information, product sampling and distribution requirements, and complying with promotion and advertising requirements, which include, among others, standards for direct-to-consumer advertising, restrictions on promoting products for uses or in patient populations that are not described in the product's approved labeling, also known as off-label use, limitations on industry-sponsored scientific and educational activities, and requirements for promotional activities involving the internet. Although physicians may prescribe legally available drugs and biologics for off-label uses, manufacturers may not market or promote such off-label uses. Modifications or enhancements to the product or its labeling or changes of the site of manufacture are often subject to the approval of the FDA and other regulators, which may or may not be received or may result in a lengthy review process. Prescription drug promotional materials must be submitted to the FDA in conjunction with their first use. Any distribution of prescription drug products

and pharmaceutical samples must comply with the U.S. Prescription Drug Marketing Act, or the PDMA, a part of the FDCA.

In the United States, once a product is approved, its manufacture is subject to comprehensive and continuing regulation by the FDA. The FDA regulations require that products be manufactured in specific approved facilities and in accordance with cGMP. Moreover, the constituent parts of a combination product retain their regulatory status, for example, as a biologic or device, and as such, we may be subject to additional requirements in the Quality System Regulation, or QSR, applicable to medical devices, such as design controls, purchasing controls, and corrective and preventive action. We rely, and expect to continue to rely, on third parties for the production of clinical and commercial quantities of our products in accordance with cGMP regulations. cGMP regulations require, among other things, quality control and quality assurance as well as the corresponding maintenance of records and documentation and the obligation to investigate and correct any deviations from cGMP. Manufacturers and other entities involved in the manufacture and distribution of approved products are required to register their establishments with the FDA and certain state agencies, and are subject to periodic unannounced inspections by the FDA and certain state agencies for compliance with cGMP and other laws. Accordingly, manufacturers must continue to expend time, money, and effort in the area of production and quality control to maintain cGMP compliance. These regulations also impose certain organizational, procedural and documentation requirements with respect to manufacturing and quality assurance activities. BLA holders using contract manufacturers, laboratories or packagers are responsible for the selection and monitoring of qualified firms, and, in certain circumstances, qualified suppliers to these firms. These firms and, where applicable, their suppliers are subject to inspections by the FDA at any time, and the discovery of violative conditions, including failure to conform to cGMP, could result in enforcement actions that interrupt the operation of any such facilities or the ability to distribute products manufactured, processed or tested by them. Discovery of problems with a product after approval may result in restrictions on a product, manufacturer, or holder of an approved BLA, including, among other things, recall or withdrawal of the product from the market.

The FDA also may require post-approval testing, sometimes referred to as Phase 4 testing, REMS and post-marketing surveillance to monitor the effects of an approved product or place conditions on an approval that could restrict the distribution or use of the product. Discovery of previously unknown problems with a product or the failure to comply with applicable FDA requirements can have negative consequences, including adverse publicity, judicial or administrative enforcement, warning letters from the FDA, mandated corrective advertising or communications with doctors, and civil or criminal penalties, among others. Newly discovered or developed safety or effectiveness data may require changes to a product's approved labeling, including the addition of new warnings and contraindications, and also may require the implementation of other risk management measures. Also, new government requirements, including those resulting from new legislation, may be established, or the FDA's policies may change, which could delay or prevent regulatory approval of our products under development.

Coverage and Reimbursement

Patients in the United States and elsewhere generally rely on third-party payors to reimburse part or all of the costs associated with their prescription drugs. Accordingly, a pharmaceutical company's ability to commercialize its products successfully depends in part on the extent to which private health insurers, other third-party payors, and governmental authorities, including Medicare and Medicaid, establish appropriate coverage and reimbursement levels for its product candidates and related treatments. As a threshold for coverage and reimbursement, third-party payors generally require that products be approved for marketing by the FDA.

Coverage decisions may not favor new products when more established or lower cost therapeutic alternatives are available. The process for obtaining coverage for a product or service is separate from the process to obtain the associated reimbursement. Reimbursement levels can affect the adoption of products and services by physicians and patients. Additionally, products used in connection with medical procedures may not be reimbursed separately, but their cost may instead be bundled as part of the payment received by the provider for the procedure only. Separate reimbursement for a product or the treatment or procedure in which the product is used may not be available.

Coverage and reimbursement policies for drug products can differ significantly from payor to payor as there is no uniform policy of coverage and reimbursement for drug products among third-party payors in the United States. There may be significant delays in obtaining coverage and reimbursement as the process of determining coverage and reimbursement is often time consuming and costly which may require the provision of scientific and clinical support for the use of the product to each payor separately, with no assurance that coverage or adequate reimbursement will be obtained.

A significant trend in the U.S. healthcare industry and elsewhere is cost containment. Third-party payors have attempted to control costs by limiting coverage and the amount of reimbursement for particular products and services. Third-party payors are increasingly challenging the effectiveness of and prices charged for medical products and services. Moreover, the U.S. government, state legislatures and foreign governmental entities have shown significant

interest in implementing cost containment programs to limit the growth of government paid healthcare costs, including price controls, restrictions on reimbursement and coverage and requirements for substitution of generic products for branded prescription drugs.

Healthcare Reform

In both the United States and certain foreign jurisdictions there have been, and continue to be, a number of legislative and regulatory changes to the healthcare system that impact the ability to sell pharmaceutical products profitably. In the United States, the federal government enacted the Patient Protection and Affordable Care Act, as amended by the Health Care and Education Reconciliation Act, or collectively, the ACA. Among the ACA's provisions of importance to the pharmaceutical industry are that it:

- created an annual, nondeductible fee on any entity that manufactures or imports certain specified branded prescription drugs and biologic agents apportioned among these entities according to their market share in some government healthcare programs;
- increased the statutory minimum rebates a manufacturer must pay under the Medicaid Drug Rebate Program, to 23.1% and 13% of the average manufacturer price for most branded and generic drugs, respectively and capped the total rebate amount for innovator drugs at 100% of the Average Manufacturer Price, or AMP;
- created new methodology by which rebates owed by manufacturers under the Medicaid Drug Rebate Program are calculated for certain drugs and biologics that are inhaled, infused, instilled, implanted or injected;
- expanded eligibility criteria for Medicaid programs by, among other things, allowing states to offer Medicaid coverage to additional individuals and by adding new mandatory eligibility categories for individuals with income at or below 133% of the federal poverty level, thereby potentially increasing manufacturers' Medicaid rebate liability;
- expanded the entities eligible for discounts under the Public Health program;
- created a new Patient-Centered Outcomes Research Institute to oversee, identify priorities in, and conduct comparative clinical effectiveness research, along with funding for such research;
- established a Center for Medicare & Medicaid Innovation at the Centers for Medicare & Medicaid Services, or CMS, to test innovative payment and service delivery models to lower Medicare and Medicaid spending, potentially including prescription drug spending that began on January 1, 2011; and
- created a licensure framework for follow on biologic products.

Some of the provisions of the ACA have yet to be implemented, and there have been judicial and Congressional challenges to certain aspects of the ACA, as well as recent efforts by the Trump administration to repeal or replace certain aspects of the ACA. Since January 2017, President Trump has signed two Executive Orders and other directives designed to delay the implementation of certain provisions of the ACA. Concurrently, Congress has considered legislation that would repeal or repeal and replace all or part of the ACA. While Congress has not passed comprehensive repeal legislation, it has enacted laws that modify certain provisions of the ACA such as removing penalties, starting January 1, 2019, for not complying with the ACA's individual mandate to carry health insurance and delaying the implementation of certain ACA-mandated fees. On December 14, 2018, a Texas U.S. District Court Judge ruled that the ACA is unconstitutional in its entirety because the "individual mandate" was repealed by Congress as part of the Tax Cuts and Jobs Act of 2017. While the Texas U.S. District Court Judge, as well as the Trump administration and CMS, have stated that the ruling will have no immediate effect pending appeal of the decision, it is unclear how this decision, subsequent appeals, and other efforts to repeal and replace the ACA will impact the ACA.

Further there has been heightened governmental scrutiny in the United States of pharmaceutical pricing practices in light of the rising cost of prescription drugs and biologics. Such scrutiny has resulted in several recent congressional inquiries and proposed and enacted federal and state legislation designed to, among other things, bring more transparency to product pricing, review the relationship between pricing and manufacturer patient programs, and reform government program reimbursement methodologies for products. For example, the Trump administration released a "Blueprint" to lower drug prices and reduce out of pocket costs of drugs that contains additional proposals to increase drug manufacturer competition, increase the negotiating power of certain federal healthcare programs, incentivize manufacturers to lower the list price of their products, and reduce the out of pocket costs of drug products paid by consumers. On January 31, 2019, the U.S. Department of Health and Human Services, Office of Inspector General, proposed modifications to the federal healthcare program Anti-Kickback Statute discount safe harbor for the purpose of reducing the cost of drug products to consumers which, among other things, if finalized, will affect discounts paid by manufacturers to Medicare Part D plans, Medicaid managed care organizations and pharmacy benefit managers working with these organizations. While some of these and other proposed measures may require additional authorization to

become effective, Congress and the Trump administration have each indicated that it will continue to seek new legislative and/or administrative measures to control drug costs.

Moreover, on May 30, 2018, the Trickett Wendler, Frank Mongiello, Jordan McLinn, and Matthew Bellina Right to Try Act of 2017, or the Right to Try Act, was signed into law. The law, among other things, provides a federal framework for certain patients to access certain investigational new drug products that have completed a Phase I clinical trial and that are undergoing investigation for FDA approval. Under certain circumstances, eligible patients can seek treatment without enrolling in clinical trials and without obtaining FDA permission under the FDA expanded access program. There is no obligation for a drug manufacturer to make its drug products available to eligible patients as a result of the Right to Try Act.

Healthcare Laws

Certain federal, state, local and foreign healthcare laws and regulations pertaining to fraud and abuse, transparency, patients' rights, and privacy are applicable to the business of a pharmaceutical company. The laws that may affect a pharmaceutical company's ability to operate include:

- the federal healthcare program Anti-Kickback Statute, which prohibits, among other things, people from soliciting, receiving or providing remuneration, directly or indirectly, to induce or reward either the referral of an individual, or the purchasing, ordering, or leasing of an item, good, facility or service, for which payment may be made by a federal healthcare program such as Medicare or Medicaid;
- federal civil and criminal false claims laws, including the civil False Claims Act, which prohibit, among other things, individuals or entities from knowingly presenting, or causing to be presented, claims for payment from Medicare, Medicaid, or other third-party payors that are false or fraudulent;
- the federal Health Insurance Portability and Accountability Act of 1996, or HIPAA, which prohibits, among other things, executing a scheme to defraud any healthcare benefit program or making false statements relating to healthcare matters;
- HIPAA, as amended by the Health Information Technology for Economic and Clinical Health Act, and their implementing regulations, which imposes certain requirements relating to the privacy, security and transmission of individually identifiable health information on certain individuals and entities;
- the Physician Payments Sunshine Act, created under the ACA, which requires pharmaceutical companies to record any transfers of value made to doctors and teaching hospitals, as well as ownership and investment interests held by physicians and their immediate family members, and to annually report such data to CMS;
- the Federal Food, Drug, and Cosmetic Act, which among other things, strictly regulates drug product marketing, prohibits manufacturers from marketing drug products for off-label use and regulates the distribution of drug samples;
- the U.S. Foreign Corrupt Practices Act, which, among other things, prohibits companies issuing stock in the U.S. from bribing foreign officials for government contracts and other business; and
- state law equivalents of each of the above federal laws, such as anti-kickback and false claims laws which may apply to items or services reimbursed by any third-party payor, including commercial insurers, state and local laws requiring the registration of pharmaceutical sales and medical representatives, and state laws governing the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways and often are not preempted by HIPAA, thus complicating compliance efforts; and
- additional state and local laws such as laws in California and Massachusetts, which mandate implementation of compliance programs, compliance with industry ethics codes, and spending limits, and other state and local laws, such as laws in Vermont, Maine, and Minnesota which require reporting to state governments of gifts, compensation, and other remuneration to physicians.

A pharmaceutical company will need to spend substantial time and money to ensure that its business arrangements with third parties comply with applicable healthcare laws and regulations. Because of the breadth of these laws and the narrowness of the statutory exceptions and regulatory safe harbors available, which require strict compliance in order to offer protection, it is possible that governmental authorities may conclude that its business practices do not comply with current or future statutes, regulations, agency guidance or case law involving applicable healthcare laws. If a pharmaceutical company's operations are found to be in violation of any of the laws described above or any other governmental regulations that apply to it, it may be subject to significant penalties, including administrative, civil and criminal penalties, damages, fines, disgorgement, possible exclusion from participation in Medicare, Medicaid and other

federal healthcare programs, imprisonment, integrity and/or other oversight obligations, contractual damages, reputational harm and the curtailment or restructuring of operations.

Other Regulations

We also are subject to various federal, state and local laws, regulations, and recommendations relating to safe working conditions, laboratory and manufacturing practices, the experimental use of animals, and the use and disposal of hazardous or potentially hazardous substances, including radioactive compounds and infectious disease agents, used in connection with our research. The extent of government regulation that might result from any future legislation or administrative action cannot be accurately predicted.

Commercialization and Manufacturing

Because of the broad potential applications of our technologies, we intend to develop and commercialize products both on our own and through our collaborators and licensees. We intend to develop and commercialize products in well-defined specialty markets, such as infectious diseases and cancer. Where appropriate, we intend to rely on strategic marketing and distribution alliances.

We believe our plasmids can be produced in commercial quantities through uniform methods of fermentation and processing that are applicable to all plasmids. We believe we will be able to obtain sufficient supplies of plasmids for all foreseeable clinical investigations.

Relationship with GeneOne

We acquired an equity interest in GeneOne in 2005. As of December 31, 2019, we owned 7.5% of the outstanding capital stock of GeneOne and GeneOne owned 73,590 shares of our common stock. To our knowledge, none of our current officers, directors, or key employees beneficially owns, directly or indirectly, any securities of GeneOne.

In 2008, we sold our manufacturing operations (including patent rights to certain manufacturing technology) to VGXI, Inc., a wholly-owned United States subsidiary of GeneOne. In connection with this transfer we entered into a Supply Agreement pursuant to which VGXI, Inc., a cGMP contract manufacturer, produces and supplies the DNA plasmids for all of our research and early clinical trials. The price of the plasmids we purchase from VGXI, Inc. is determined by us and GeneOne at the time of order placement or, with respect to product supplied in connection with a grant contract, based on the contracted bid provided by the applicable agency. We agreed to treat GeneOne and its subsidiary as our most favored supplier for DNA plasmids and GeneOne and its subsidiary agreed to treat us as their most favored customer. Before we can manufacture DNA plasmids on our own behalf or engage a third party other than GeneOne or its subsidiary to manufacture DNA plasmids for us, we must first offer such manufacturing work to GeneOne or its subsidiary.

In 2014, we entered into a Collaborative Development Agreement with GeneOne to co-develop an Ebola vaccine through Phase 1 clinical trials. In 2015, we amended the agreement to provide that we would have control over the development program, in return for the payment of certain development fees.

In 2015, we entered into a Collaborative Development Agreement with GeneOne to co-develop a DNA vaccine for MERS through Phase 1 clinical trials. Under the terms of the agreement, GeneOne will be responsible for funding all preclinical and clinical studies through Phase 1. In return, GeneOne will receive up to 35% milestone-based ownership interest in the MERS immunotherapy upon achievement of the last milestone event of completion of the Phase 1 safety and immunogenicity study. The collaborative research program will terminate upon the completion of activities under the development plan, unless sooner terminated.

In January 2016, we and GeneOne expanded the collaboration agreement to test and advance our DNA-based vaccine for preventing and treating Zika virus. GeneOne will be responsible for funding all preclinical and clinical studies through Phase 1. In return, GeneOne will receive up to a 35% milestone-based ownership interest in the Zika immunotherapy upon achievement of the last milestone event of the completion of the Phase 1 safety and immunogenicity study.

In December 2017, we completed the sale of certain assets related to our compound VGX-1027 to GeneOne for \$1.0 million.

Revenue recognized from GeneOne consists of patent and device maintenance fees from the influenza, HCV and Zika collaborations. For the years ended December 31, 2019 and 2018, we recognized revenue from GeneOne of \$127,000 and \$342,000, respectively. Operating expenses recorded from transactions with GeneOne relate primarily to biologics manufacturing. These operating expenses for the years ended December 31, 2019 and 2018 were \$2.5 million and \$7.0 million, respectively. At December 31, 2019 and 2018, we had an accounts payable and accrued liability balance of \$511,000 and \$372,000, respectively, related to GeneOne and its subsidiaries. At December 31, 2019 and

2018, \$284,000 and \$381,000, respectively, of prepayments made to GeneOne were classified as long-term other assets on our consolidated balance sheet.

Intellectual Property

Patents and other proprietary rights are essential to our business. We file patent applications to protect our technologies, inventions and improvements to our inventions that we consider important to the development of our business. We file for patent registration extensively in the United States and in key foreign markets. Although our patent filings include claims covering various features of our products and product candidates, including composition, methods of manufacture and use, our patents do not provide us with complete protection, or guarantee, against the development of competing products. In addition, some of our know-how and technology are not patentable. We thus also rely upon trade secrets, know-how, continuing technological innovations and licensing opportunities to develop and maintain our competitive position. We also require employees, consultants, advisors and collaborators to enter into confidentiality agreements, but such agreements may provide limited protection for our trade secrets, know-how or other proprietary information.

Our intellectual property portfolio covers our proprietary technologies, including CELLECTRA® delivery as well as immunotherapy and vaccine construct related technologies. As of December 31, 2019, our patent portfolio included approximately 90 issued United States patents and over 500 issued foreign counterpart patents. In addition, we have numerous patent applications pending in the United States and various foreign jurisdictions.

If we fail to protect our intellectual property rights adequately our competitors might gain access to our technology and our business would thus be harmed. In addition, defending our intellectual property rights might entail significant expense. Any of our intellectual property rights may be challenged by others or invalidated through administrative processes or litigation through the courts. In addition, our patents, or any other patents that may be issued to us in the future, may not provide us with any competitive advantages, or may be challenged by third parties. Furthermore, legal standards relating to the validity, enforceability and scope of protection of intellectual property rights are uncertain. Effective patent, trademark, copyright and trade secret protection may not be available to us in each country where we operate. The laws of some foreign countries may not be as protective of intellectual property rights as those in the United States, and domestic and international mechanisms for enforcement of intellectual property rights in those countries may be inadequate. Accordingly, despite our efforts, we may be unable to prevent third parties from infringing upon or misappropriating our intellectual property or otherwise gaining access to our technology. We may be required to expend significant resources to monitor and protect our intellectual property rights. We may initiate claims or litigation against third parties for infringement of our proprietary rights or to establish the validity of our proprietary rights. Any such litigation, whether or not it is ultimately resolved in our favor, would result in significant expense to us and divert the efforts of our technical and management personnel.

There may be rights we are not aware of, including applications that have been filed but not published that, when issued, could be asserted against us. These third-parties could bring claims against us, and that would cause us to incur substantial expenses and, if successful against us, could cause us to pay substantial damages. Further, if a patent infringement suit were brought against us, we could be forced to stop or delay research, development, manufacturing or sales of the product or biologic drug candidate that is the subject of the suit. As a result of patent infringement claims, or in order to avoid potential claims, we may choose or be required to seek a license from the third-party. These licenses may not be available on acceptable terms, or at all. Even if we are able to obtain a license, the license would likely obligate us to pay license fees or royalties or both, and the rights granted to us might be non-exclusive, which could result in our competitors gaining access to the same intellectual property. Ultimately, we could be prevented from commercializing a product, or be forced to cease some aspect of our business operations, if, as a result of actual or threatened patent infringement claims, we are unable to enter into licenses on acceptable terms. All of the issues described above could also impact our collaborators, which would also impact the success of the collaboration and therefore us.

Important legal issues remain to be resolved as to the extent and scope of available patent protection for biologic products, including vaccines, and processes in the United States and other important markets outside the United States, such as Europe and Japan. Foreign markets may not provide the same level of patent protection as provided under the United States patent system. We recognize that litigation or administrative proceedings may be necessary to determine the validity and scope of certain of our and others' proprietary rights. Any such litigation or proceeding may result in a significant commitment of resources in the future and could force us to interrupt our operations, redesign our products or processes, or negotiate a license agreement, all of which would adversely affect our revenue. Furthermore, changes in, or different interpretations of, patent laws in the United States and other countries may result in patent laws that allow others to use our discoveries or develop and commercialize our products.

We cannot guarantee that the patents we obtain or the unpatented technology we hold will afford us significant commercial protection.

Significant Customers and Research and Development

During the year ended December 31, 2019, we derived 78% of our revenue from AstraZeneca. During the year ended December 31, 2018, we derived 75% of our revenue from ApolloBio and 23% of our revenue from AstraZeneca. During the year ended December 31, 2017, we derived 53% of our revenue from AstraZeneca, 24% of our revenue from DARPA and 14% of our revenue from Roche. Since our inception, virtually all of our activities have consisted of research and development efforts related to developing our electroporation technologies and immunotherapies. Research and development expense consists of expenses incurred in performing research and development activities including salaries and benefits, facilities and other overhead expenses, clinical trials, contract services and other outside expenses. Our research and development expense was \$88.0 million in 2019, \$95.3 million in 2018 and \$98.6 million in 2017.

Geographic Information

All of our revenue for the years ended December 31, 2019, 2018 and 2017 was earned in the United States. All of our long-lived assets are located in the United States.

Corporate History and Headquarters

We have been a leader in advancing the capabilities of DNA-based immunotherapies to treat infectious diseases and cancers going back to the original incorporation of Viral Genomix, Inc. under the laws of Delaware on April 17, 2000. We were renamed VGX Pharmaceuticals, Inc. on May 31, 2006. On February 21, 2007, VGX Pharmaceuticals acquired Advisys, Inc., a company possessing DNA and electroporation technology, through an asset purchase agreement. On April 14, 2007, VGX Pharmaceuticals entered into an exclusive license agreement with the Trustees of the University of Pennsylvania related to therapeutic and prophylactic DNA vaccines developed by Professor David B. Weiner at the University of Pennsylvania School of Medicine.

Recognizing the value of electroporation delivery technology, devices, and patents in advancing DNA-based immunotherapy products, on June 1, 2009, VGX Pharmaceuticals completed a merger with Inovio Biomedical Corporation, a publicly listed company focused on electroporation delivery technology.

Inovio Biomedical Corporation started as Biotechnologies & Experimental Research, Inc. and was incorporated on June 29, 1983 in California to create products for the research marketplace. The company changed its corporate name to BTX, Inc. on December 10, 1991, and to Genetronics, Inc. on February 8, 1994. On April 14, 1994, Genetronics, Inc. became a public company through a share exchange agreement with Consolidated United Safety Technologies, Inc., a company listed on the Vancouver Stock Exchange under the laws of British Columbia, Canada. The company changed its name to Genetronics Biomedical Ltd. on September 29, 1994. Genetronics, Inc. remained as a wholly owned operating subsidiary. On September 2, 1997, the company listed on the Toronto Stock Exchange. On December 8, 1998, the company listed on the American Stock Exchange (now NYSE MKT) and voluntarily de-listed from the Toronto Stock Exchange on January 17, 2003. On June 15, 2001, Genetronics Biomedical Ltd. completed a change in jurisdiction of incorporation from British Columbia, Canada, to the state of Delaware and became Genetronics Biomedical Corporation. On January 25, 2005, Genetronics Biomedical Corporation acquired Inovio AS, a gene delivery technology company located in Norway. On March 31, 2005, Genetronics Biomedical Corporation was renamed Inovio Biomedical Corporation.

The merger between VGX Pharmaceuticals and Inovio Biomedical Corporation was effected pursuant to the terms of an Amended and Restated Agreement and Plan of Merger dated December 5, 2008, as further amended on March 31, 2009. On May 14, 2010, the combined entity changed its corporate name to Inovio Pharmaceuticals, Inc. We conduct our business through our United States wholly-owned subsidiaries, VGX Pharmaceuticals, LLC and Genetronics, Inc.

Our corporate headquarters are located at 660 W. Germantown Pike, Suite 110, Plymouth Meeting, Pennsylvania 19462, and our telephone number is (267) 440-4200.

Available Information

Our Internet website address is www.inovio.com. In addition to the information contained in this Annual Report, information about us can be found on our website. Our website and information included in or linked to our website are not part of this Annual Report.

We make our annual report on Form 10-K, quarterly reports on Form 10-Q, current reports on Form 8-K and amendments to those reports filed or furnished pursuant to Section 13(a) or 15(d) of the Securities Exchange Act of 1934, or the Exchange Act, available free of charge on our website as soon as reasonably practicable after we electronically file such material with, or furnish it to, the Securities and Exchange Commission, or the SEC. The SEC maintains an Internet site (www.sec.gov) that contains reports, proxy and information statements, and other information regarding issuers that file electronically with the SEC, including us.

Information regarding our corporate governance, including the charters of our audit committee, our nomination and corporate governance committee and our compensation committee, our Code of Business Conduct and Ethics, our Corporate Governance Guidelines, our Corporate Governance Policy and information for contacting our board of directors is available on our website.

Our Code of Business Conduct and Ethics includes our Code of Ethics applicable to our Chief Executive Officer and Chief Financial Officer, who also serves as our principal accounting officer. Any amendments to or waivers of the Code of Ethics will be promptly posted on our website or in a report on Form 8-K, as required by applicable law.

Employees

As of March 6, 2020, we employed 190 people on a full-time basis and 4 people under consulting and project employment agreements. Of the combined total, 153 were in product research, which includes research and development, quality assurance, clinical, engineering, and manufacturing, and 41 were in general and administrative functions, which includes corporate development, information technology, legal, investor relations, finance and corporate administration. None of our employees are subject to collective bargaining agreements.

ITEM 1A. RISK FACTORS

You should carefully consider the following factors regarding information included in this Annual Report. The risks and uncertainties described below are not the only ones we face. Additional risks and uncertainties not presently known to us or that we currently deem immaterial also may impair our business operations. If any of the following risks actually occur, our business, financial condition and operating results could be materially adversely affected.

Risks Related to Our Business and Industry

We have incurred losses since inception, expect to incur significant net losses in the foreseeable future and may never become profitable.

We have experienced significant operating losses to date. As of December 31, 2019 our accumulated deficit was \$739.8 million. We have generated limited revenues, primarily consisting of license revenue, grant funding and interest income. We expect to continue to incur substantial additional operating losses for at least the next several years as we advance our clinical trials and research and development activities. We may never successfully commercialize our DNA vaccine and DNA immunotherapy product candidates or electroporation-based synthetic vaccine delivery technology and thus may never have any significant future revenues or achieve and sustain profitability.

We have limited sources of revenue and our success is dependent on our ability to develop our DNA vaccines and DNA immunotherapies and electroporation equipment.

We do not sell any products and may not have any other products commercially available for several years, if at all. Our ability to generate future revenues depends heavily on our success in:

- developing and securing United States and/or foreign regulatory approvals for our product candidates, including securing regulatory approval for conducting clinical trials with product candidates;
- developing our electroporation-based DNA delivery technology; and
- commercializing any products for which we receive approval from the FDA and foreign regulatory authorities.

Our electroporation equipment and product candidates will require extensive additional clinical study and evaluation, regulatory approval in multiple jurisdictions, substantial investment and significant marketing efforts before we generate any revenues from product sales. We are not permitted to market or promote our electroporation equipment and product candidates before we receive regulatory approval from the FDA or comparable foreign regulatory authorities. If we do not receive regulatory approval for and successfully commercialize any products, we will not generate any revenues from sales of electroporation equipment and products, and we may not be able to continue our operations.

None of our human vaccine and immunotherapy product candidates have been approved for sale, and we may not develop commercially successful vaccine products.

Our human vaccine and immunotherapy programs are in the early stages of research and development, and currently include product candidates in discovery, preclinical studies and Phase 1, 2 and 3 clinical trials. There are limited data regarding the efficacy of synthetic vaccine and immunotherapy candidates compared with conventional vaccines, and we must conduct a substantial amount of additional research and development before any regulatory authority will approve any of our vaccine product candidates. The success of our efforts to develop and commercialize our product candidates could fail for a number of reasons. For example, we could experience delays in product development and clinical trials. Our product candidates could be found to be ineffective or unsafe, or otherwise fail to receive necessary regulatory clearances. The products, if safe and effective, could be difficult to manufacture on a large scale or uneconomical to market, or our competitors could develop superior products more quickly and efficiently or more effectively market their competing products.

In addition, adverse events, or the perception of adverse events, relating to vaccine and immunotherapy candidates and delivery technologies may negatively impact our ability to develop commercially successful products. For example, pharmaceutical companies have been subject to claims that the use of some pediatric vaccines has caused personal injuries, including brain damage, central nervous system damage and autism. These and other claims may influence public perception of the use of vaccine and immunotherapy products and could result in greater governmental regulation, stricter labeling requirements and potential regulatory delays in the testing or approval of our potential products.

Our substantial indebtedness could limit the cash flow available for our operations and could expose us to risks that could adversely affect our business, financial condition and results of operations.

During 2019, we sold \$78.5 million aggregate principal amount of 6.50% convertible senior notes due 2024, or the Notes, as well as \$15.0 million and \$4.1 million aggregate principal amount of 1.0% convertible bonds due August 2024 and December 2024, respectively, or the August 2019 Bonds and the December 2019 Bonds, respectively. We may also incur

additional indebtedness to meet future financing needs. Our indebtedness could have significant negative consequences for our security holders and our business, results of operations and financial condition by, among other things:

- increasing our vulnerability to adverse economic and industry conditions;
- limiting our ability to obtain additional financing;
- requiring the dedication of a substantial portion of our cash flow from operations to service our indebtedness, which will reduce the amount of cash available for other purposes;
- limiting our flexibility to plan for, or react to, changes in our business;
- diluting the interests of our existing stockholders if we issue shares of our common stock upon conversion of the Notes, the August 2019 Bonds and the December 2019 Bonds in accordance with their respective terms; and
- placing us at a possible competitive disadvantage with competitors that are less leveraged than us or have better access to capital.

Our business may not generate sufficient funds, and we may otherwise be unable to maintain sufficient cash reserves, to pay amounts due under the Notes, the August 2019 Bonds and the December 2019 Bonds and any additional indebtedness that we may incur. In addition, our cash needs may increase in the future. In addition, any future indebtedness that we may incur may contain financial and other restrictive covenants that limit our ability to operate our business, raise capital or make payments under our other indebtedness. If we fail to comply with these covenants or to make payments under our indebtedness when due, then we would be in default under that indebtedness, which could, in turn, result in that and our other indebtedness becoming immediately payable in full.

The conditional conversion features of the Notes, if triggered, may adversely affect our financial condition, operating results, or liquidity.

In the event the conditional conversion feature of the Notes is triggered, holders of the Notes will be entitled to convert their Notes into shares of our common stock at any time during specified periods at their option. If one or more of the holders of the Notes elects to convert their Notes, unless we satisfy our conversion obligation by delivering only shares of our common stock, we would be required to settle all or a portion of our conversion obligation through the payment of cash, which could adversely affect our liquidity. The conditional convertibility of the Notes will be monitored at each quarterly reporting date and analyzed dependent upon market prices of our common stock during the prescribed measurement periods.

Conversion of the Notes, the August 2019 Bonds and/or the December 2019 Bonds will dilute the ownership interest of existing stockholders, and may otherwise depress the price of our common stock.

The conversion of some or all of the Notes, the August 2019 Bonds and/or December 2019 Bonds will dilute the ownership interests of existing stockholders to the extent we deliver shares of our common stock upon conversion of any of the Notes. The Notes may become in the future convertible at the option of the holders of the Notes prior to November 1, 2023 under certain circumstances as provided in the indenture governing the Notes. The August 2019 Bonds and December 2019 Bonds may become in the future convertible at the option of the holders of the August 2019 Bonds and December 2019 Bonds starting August 1, 2020 and December 31, 2020, respectively, until the date that is one month prior to maturity date of the August 2019 Bonds and December 2019 Bonds. Any sales in the public market of the common stock issuable upon such conversion could adversely affect prevailing market prices of our common stock. In addition, the existence of the Notes may encourage short selling by market participants because the conversion of the Notes could be used to satisfy short positions, or anticipated conversion of the Notes into shares of our common stock could depress the price of our common stock.

We may not have the ability to raise the funds necessary to settle conversions of the Notes in cash, to repurchase the Notes or the August 2019 Bonds or the December 2019 Bonds upon a fundamental change or to repurchase the August 2019 Bonds and the December 2019 Bonds from and including July 31, 2022 and December 31, 2022 up to the date falling one month prior to the maturity date of the August 2019 Bonds and December 2019 Bonds, and our future debt may contain limitations on our ability to pay cash upon conversion or repurchase of the Notes.

Subject to certain conditions, holders of the Notes or the August 2019 Bonds or the December 2019 Bonds may require us to repurchase for cash all or a portion of their Notes or August 2019 Bonds or December 2019 Bonds, respectively, upon the occurrence of a fundamental change (as defined in the indenture governing the Notes or the August 2019 Bonds or the December 2019 Bonds, respectively) at a repurchase price equal to 100% of the principal amount of the Notes or the August 2019 Bonds or the December 2019 Bonds, as applicable, to be repurchased, plus accrued and unpaid interest, if any, to, but excluding, the fundamental change repurchase date. In addition, if a make-whole fundamental change (as defined in the indenture for the Notes) occurs prior to the maturity date of the Notes, we will in some cases be required to increase the conversion rate for a holder that elects to convert its Notes in connection with such make-whole fundamental change. The August 2019 Bonds and December 2019 Bonds will be subject to repurchase by us at the option of the holders thereof from and

including July 31, 2022 and December 31, 2022, respectively, up to the date falling one month prior to the maturity date at a repurchase price equal to the principal of the August 2019 Bonds and December 2019 Bonds to be repurchased plus a premium on such August 2019 Bonds and December 2019 Bonds in order to provide an internal rate of return with respect to such August 2019 Bonds and December 2019 Bonds of 6.00%. Upon a conversion of the Notes, unless we elect to deliver solely shares of our common stock to settle such conversion (other than paying cash in lieu of delivering any fractional share), we will be required to make cash payments in respect of the Notes being converted. However, we may not have enough available cash or be able to obtain financing at the time we are required to make repurchases of Notes or August 2019 Bonds or December 2019 Bonds surrendered for repurchase or pay cash with respect to Notes being converted.

In addition, our ability to repurchase or to pay cash upon conversion of the Notes may be limited by law, regulatory authority or agreements governing our future indebtedness. Our failure to repurchase the Notes at a time when the repurchase is required by the indenture governing the Notes or to pay cash upon conversion of the Notes as required by the indenture would constitute a default under the indenture. A default under the indenture or the fundamental change itself could also lead to a default under our August 2019 Bonds and December 2019 Bonds or agreements governing our future indebtedness. If the payment of the related indebtedness were to be accelerated after any applicable notice or grace periods, we may not have sufficient funds to repay the indebtedness and repurchase the Notes or the August 2019 Bonds or the December 2019 Bonds or to pay cash upon conversion of the Notes.

We will need substantial additional capital to develop our DNA vaccine and immunotherapy programs and electroporation delivery technology.

Conducting the costly and time-consuming research, pre-clinical and clinical testing necessary to obtain regulatory approvals and bring our product candidates and delivery technology to market will require a commitment of substantial funds in excess of our current capital. Our future capital requirements will depend on many factors, including, among others:

- the progress of our current and new product development programs;
- the progress, scope and results of our pre-clinical and clinical testing;
- the time and cost involved in obtaining regulatory approvals;
- the cost of manufacturing our products and product candidates;
- the cost of prosecuting, enforcing and defending against patent infringement claims and other intellectual property rights;
- debt service obligations on the Notes, the August 2019 Bonds and December 2019 Bonds;
- competing technological and market developments; and
- our ability and costs to establish and maintain collaborative and other arrangements with third parties to assist in potentially bringing our products to market.

Additional financing may not be available on acceptable terms, or at all. Domestic and international capital markets have from time to time experienced heightened volatility and turmoil, making it more difficult to raise capital through the issuance of equity securities. Volatility in the capital markets can also negatively impact the cost and availability of credit, creating illiquid credit markets and wider credit spreads. Concern about the stability of the markets generally and the strength of counterparties specifically has led many lenders and institutional investors to reduce, and in some cases cease to provide, funding to borrowers. To the extent we are able to raise additional capital through the sale of equity securities or we issue securities in connection with another transaction, the ownership position of existing stockholders could be substantially diluted. If additional funds are raised through the issuance of preferred stock or debt securities, these securities are likely to have rights, preferences and privileges senior to our common stock and may involve significant fees, interest expense, restrictive covenants and the granting of security interests in our assets. Fluctuating interest rates could also increase the costs of any debt financing we may obtain. Raising capital through a licensing or other transaction involving our intellectual property could require us to relinquish valuable intellectual property rights and thereby sacrifice long-term value for short-term liquidity.

Our failure to successfully address ongoing liquidity requirements would have a substantially negative impact on our business. If we are unable to obtain additional capital on acceptable terms when needed, we may need to take actions that adversely affect our business, our stock price and our ability to achieve cash flow in the future, including possibly surrendering our rights to some technologies or product opportunities, delaying our clinical trials or curtailing or ceasing operations.

We depend upon key personnel who may terminate their employment with us at any time and we may need to hire additional qualified personnel in order to obtain financing, pursue collaborations or develop or market our product candidates.

The success of our business strategy will depend to a significant degree upon the continued services of key management, technical and scientific personnel and our ability to attract and retain additional qualified personnel and managers, including

personnel with expertise in clinical trials, government regulation, manufacturing, marketing and other areas. Competition for qualified personnel is intense among companies, academic institutions and other organizations. If we are unable to attract and retain key personnel and advisors, it may negatively affect our ability to successfully develop, test, commercialize and market our products and product candidates.

We face intense and increasing competition and many of our competitors have significantly greater resources and experience.

If any of our competitors develop products with efficacy or safety profiles significantly better than our products, we may not be able to commercialize our products, and sales of any of our commercialized products could be harmed. Some of our competitors and potential competitors have substantially greater product development capabilities and financial, scientific, marketing and human resources than we do. Competitors may develop products earlier, obtain FDA approvals for products more rapidly, or develop products that are more effective than those under development by us. We will seek to expand our technological capabilities to remain competitive; however, research and development by others may render our technologies or products obsolete or noncompetitive, or result in treatments or cures superior to ours.

Many other companies are pursuing other forms of treatment or prevention for diseases that we target. For example, many of our competitors are working on developing and testing cancer vaccines and immunotherapies and several products such as the CAR-Ts developed by our competitors have been approved for human use. Our competitors and potential competitors include large pharmaceutical and more established biotechnology companies. These companies have significantly greater financial and other resources and greater expertise than us in research and development, securing government contracts and grants to support research and development efforts, manufacturing, pre-clinical and clinical testing, obtaining regulatory approvals and marketing. This may make it easier for them to respond more quickly than us to new or changing opportunities, technologies or market needs. Many of these competitors operate large, well-funded research and development programs and have significant products approved or in development. Small companies may also prove to be significant competitors, particularly through collaborative arrangements with large pharmaceutical companies or through acquisition or development of intellectual property rights. Our potential competitors also include academic institutions, governmental agencies and other public and private research organizations that conduct research, seek patent protection and establish collaborative arrangements for product and clinical development and marketing. Research and development by others may seek to render our technologies or products obsolete or noncompetitive.

If we lose or are unable to secure collaborators or partners, or if our collaborators or partners do not apply adequate resources to their relationships with us, our product development and potential for profitability will suffer.

We have entered into, and may continue to enter into, distribution, co-promotion, partnership, sponsored research and other arrangements for development, manufacturing, sales, marketing and other commercialization activities relating to our products. For example, in the past we have entered into license and collaboration agreements to develop, obtain regulatory approval for and commercialize our product candidates for specified indications, including in jurisdictions outside of the United States. The amount and timing of resources applied by our collaborators are largely outside of our control.

If any of our current or future collaborators breaches or terminates our agreements, or fails to conduct our collaborative activities in a timely manner, our commercialization of products could be diminished or blocked completely. We may not receive any event-based payments, milestone payments or royalty payments under our collaborative agreements if our collaborative partners fail to develop products in a timely manner or at all. It is possible that collaborators will change their strategic focus, pursue alternative technologies or develop alternative products, either on their own or in collaboration with others. Further, we may be forced to fund programs that were previously funded by our collaborators, and we may not have, or be able to access, the necessary funding. The effectiveness of our partners, if any, in marketing our products will also affect our revenues and earnings.

We desire to enter into new collaborative agreements. However, we may not be able to successfully negotiate any additional collaborative arrangements and, if established, these relationships may not be scientifically or commercially successful. Our success in the future depends in part on our ability to enter into agreements with other highly-regarded organizations. This can be difficult due to internal and external constraints placed on these organizations. Some organizations may have insufficient administrative and related infrastructure to enable collaborations with many companies at once, which can extend the time it takes to develop, negotiate and implement a collaboration. Once news of discussions regarding possible collaborations are known in the medical community, regardless of whether the news is accurate, failure to announce a collaborative agreement or the entity's announcement of a collaboration with another entity may result in adverse speculation about us, resulting in harm to our reputation and our business.

Disputes could also arise between us and our existing or future collaborators, as to a variety of matters, including financial and intellectual property matters or other obligations under our agreements. These disputes could be both expensive

and time-consuming and may result in delays in the development and commercialization of our products or could damage our relationship with a collaborator.

A small number of licensing partners and government contracts account for a substantial portion of our revenue.

We currently derive, and in the past we have derived, a significant portion of our revenue from a limited number of licensing partners and government grants and contracts. Revenue can fluctuate significantly depending on the timing of upfront and event-based payments and work performed. If we fail to sign additional future contracts with major licensing partners and the government, if a contract is delayed or deferred, or if an existing contract expires or is canceled and we fail to replace the contract with new business, our revenue would be adversely affected.

We have agreements with government agencies, which are subject to termination and uncertain future funding.

We have entered into agreements with government agencies, such as the NIAID and DARPA, and we intend to continue entering into these agreements in the future. Our business is partially dependent on the continued performance by these government agencies of their responsibilities under these agreements, including adequate continued funding of the agencies and their programs. We have no control over the resources and funding that government agencies may devote to these agreements, which may be subject to annual renewal and which generally may be terminated by the government agencies at any time.

Government agencies may fail to perform their responsibilities under these agreements, which may cause them to be terminated by the government agencies. In addition, we may fail to perform our responsibilities under these agreements. Many of our government agreements are subject to audits, which may occur several years after the period to which the audit relates. If an audit identifies significant unallowable costs, we could incur a material charge to our earnings or reduction in our cash position. As a result, we may be unsuccessful entering, or ineligible to enter, into future government agreements.

Our quarterly operating results may fluctuate significantly.

We expect our operating results to be subject to quarterly fluctuations. Our net loss and other operating results will be affected by numerous factors, including:

- variations in the level of expenses related to our electroporation equipment, product candidates or future development programs;
- expenses related to corporate transactions, including ones not fully completed;
- addition or termination of clinical trials or funding support;
- any intellectual property infringement lawsuit in which we may become involved;
- any legal claims that may be asserted against us or any of our officers;
- regulatory developments affecting our electroporation equipment and product candidates or those of our competitors;
- debt service obligations on the Notes, the August 2019 Bonds and the December 2019 Bonds;
- changes in the fair value of the derivative liability associated with the August 2019 Bonds;
- changes in the fair value of our investments, including investments in affiliated entities;
- our execution of any collaborative, licensing or similar arrangements, and the timing of payments we may make or receive under these arrangements; and
- if any of our products receives regulatory approval, the levels of underlying demand for our products.

If our quarterly operating results fall below the expectations of investors or securities analysts, the price of our common stock could decline substantially. Furthermore, any quarterly fluctuations in our operating results may, in turn, cause the price of our stock to fluctuate substantially. We believe that quarterly comparisons of our financial results are not necessarily meaningful and should not be relied upon as an indication of our future performance.

If we are unable to obtain FDA approval of our products, we will not be able to commercialize them in the United States.

We need FDA approval prior to marketing our electroporation equipment and products in the United States. If we fail to obtain FDA approval to market our electroporation equipment and product candidates, we will be unable to sell our products in the United States, which will significantly impair our ability to generate any revenues.

This regulatory review and approval process, which includes evaluation of pre-clinical studies and clinical trials of our products as well as the evaluation of our manufacturing processes and our third-party contract manufacturers' facilities, is lengthy, expensive and uncertain. To receive approval, we must, among other things, demonstrate with substantial evidence

from well-controlled clinical trials that our electroporation equipment and product candidates are both safe and effective for each indication for which approval is sought. Satisfaction of the approval requirements typically takes several years and the time needed to satisfy them may vary substantially, based on the type, complexity and novelty of the product. We do not know if or when we might receive regulatory approvals for our electroporation equipment and any of our product candidates currently under development. Moreover, any approvals that we obtain may not cover all of the clinical indications for which we are seeking approval, or could contain significant limitations in the form of narrow indications, warnings, precautions or contra-indications with respect to conditions of use. In such event, our ability to generate revenues from such products would be greatly reduced and our business would be harmed.

The FDA has substantial discretion in the approval process and may either refuse to consider our application for substantive review or may form the opinion after review of our data that our application is insufficient to allow approval of our electroporation equipment and product candidates. If the FDA does not consider or approve our application, it may require that we conduct additional clinical, pre-clinical or manufacturing validation studies and submit that data before it will reconsider our application. Depending on the extent of these or any other studies, approval of any applications that we submit may be delayed by several years, or may require us to expend more resources than we have available. It is also possible that additional studies, if performed and completed, may not be successful or considered sufficient by the FDA for approval or even to make our applications approvable. If any of these outcomes occur, we may be forced to abandon one or more of our applications for approval, which might significantly harm our business and prospects.

It is possible that none of our products or any product we may seek to develop in the future will ever obtain the appropriate regulatory approvals necessary for us or our collaborators to commence product sales. Any delay in obtaining, or an inability to obtain, applicable regulatory approvals would prevent us from commercializing our products, generating revenues and achieving and sustaining profitability.

Clinical trials involve a lengthy and expensive process with an uncertain outcome, and results of earlier studies and trials may not be predictive of future trial results.

Clinical testing is expensive and can take many years to complete, and its outcome is uncertain. Failure can occur at any time during the clinical trial process. The results of pre-clinical studies and early clinical trials of our products may not be predictive of the results of later-stage clinical trials. Results from one study may not be reflected or supported by the results of similar studies. Results of an animal study may not be indicative of results achievable in human studies. Human-use equipment and product candidates in later stages of clinical trials may fail to show the desired safety and efficacy traits despite having progressed through pre-clinical studies and initial clinical testing. The time required to obtain approval by the FDA and similar foreign authorities is unpredictable but typically takes many years following the commencement of clinical trials, depending upon numerous factors. In addition, approval policies, regulations, or the type and amount of clinical data necessary to gain approval may change. We have not obtained regulatory approval for any human-use products.

Our products could fail to complete the clinical trial process for many reasons, including the following:

- we may be unable to demonstrate to the satisfaction of the FDA or comparable foreign regulatory authorities that our electroporation equipment and a product candidate are safe and effective for any indication;
- the results of clinical trials may not meet the level of statistical significance required by the FDA or comparable foreign regulatory authorities for approval;
- the FDA or comparable foreign regulatory authorities may disagree with the design or implementation of our clinical trials;
- we may not be successful in enrolling a sufficient number of participants in clinical trials;
- we may be unable to demonstrate that our electroporation equipment and a product candidate's clinical and other benefits outweigh its safety risks;
- we may be unable to demonstrate that our electroporation equipment and a product candidate presents an advantage over existing therapies, or over placebo in any indications for which the FDA requires a placebo-controlled trial;
- the FDA or comparable foreign regulatory authorities may disagree with our interpretation of data from pre-clinical studies or clinical trials;
- the data collected from clinical trials of our product candidates may not be sufficient to support the submission of a new drug application or other submission or to obtain regulatory approval in the United States or elsewhere;
- the FDA or comparable foreign regulatory authorities may fail to approve the manufacturing processes or facilities of us or third-party manufacturers with which we or our collaborators contract for clinical and commercial supplies; and

- the approval policies or regulations of the FDA or comparable foreign regulatory authorities may significantly change in a manner rendering our clinical data insufficient for approval.

Our product candidates are combination products regulated under both the biologic and device regulations of the Public Health Service Act and Federal Food, Drug, and Cosmetic Act. Third-party manufacturers may not be able to comply with cGMP regulations, regulations applicable to biologic/device combination products, including applicable provisions of the FDA's drug cGMP regulations, device cGMP requirements embodied in the QSR or similar regulatory requirements outside the United States. Our failure, or the failure of our third-party manufacturers, to comply with applicable regulations could result in sanctions being imposed on us, including clinical holds, fines, injunctions, civil penalties, delays, suspension or withdrawal of approvals, license revocation, seizures or recalls of product candidates, operating restrictions and criminal prosecutions, any of which could significantly affect supplies of our product candidates.

Delays in the commencement or completion of clinical testing could result in increased costs to us and delay or limit our ability to generate revenues.

Delays in the commencement or completion of clinical testing could significantly affect our product development costs. We do not know whether planned clinical trials will begin on time or be completed on schedule, if at all. In addition, ongoing clinical trials may not be completed on schedule, or at all, and could be placed on a hold by the regulators for various reasons. The commencement and completion of clinical trials can be delayed for a number of reasons, including delays related to:

- obtaining regulatory approval to commence a clinical trial;
- adverse results from third party clinical trials involving gene-based therapies and the regulatory response thereto;
- reaching agreement on acceptable terms with prospective CROs and trial sites, the terms of which can be subject to extensive negotiation and may vary significantly among different CROs and trial sites;
- future bans or stricter standards imposed on clinical trials of gene-based therapy;
- manufacturing sufficient quantities of our electroporation equipment and product candidates for use in clinical trials;
- obtaining institutional review board, or IRB, approval to conduct a clinical trial at a prospective site;
- slower than expected recruitment and enrollment of patients to participate in clinical trials for a variety of reasons, including competition from other clinical trial programs for similar indications;
- conducting clinical trials with sites internationally due to regulatory approvals and meeting international standards;
- retaining patients who have initiated a clinical trial but may be prone to withdraw due to side effects from the therapy, lack of efficacy or personal issues, or who are lost to further follow-up;
- collecting, reviewing and analyzing our clinical trial data; and
- global unrest, global pathogen outbreaks or pandemics, terrorist activities, and economic and other external factors.

Clinical trials may also be delayed as a result of ambiguous or negative interim results. In addition, a clinical trial may be suspended or terminated by us, the FDA, the IRB overseeing the clinical trial at issue, any of our clinical trial sites with respect to that site, or other regulatory authorities due to a number of factors, including:

- failure to conduct the clinical trial in accordance with regulatory requirements or our clinical protocols;
- inspection of the clinical trial operations or trial sites by the FDA or other regulatory authorities resulting in the imposition of a clinical hold;
- unforeseen safety issues; and
- lack of adequate funding to continue the clinical trial.

If we experience delays in completion of, or if we terminate, any of our clinical trials, the commercial prospects for our electroporation equipment and our product candidates may be harmed and our ability to generate product revenues will be delayed. In addition, many of the factors that cause, or lead to, a delay in the commencement or completion of clinical trials may also ultimately lead to the denial of regulatory approval of a product candidate. Further, delays in the commencement or completion of clinical trials may adversely affect the trading price of our common stock.

We and our collaborators rely on third parties to conduct our clinical trials. If these third parties do not successfully carry out their contractual duties or meet expected deadlines, we and our collaborators may not be able to obtain regulatory approval for or commercialize our product candidates.

We and our collaborators have entered into agreements with CROs to provide monitors for and to manage data for our on-going clinical programs. We and the CROs conducting clinical trials for our electroporation equipment and product candidates are required to comply with current good clinical practices, or GCPs, regulations and guidelines enforced by the FDA for all of our products in clinical development. The FDA enforces GCPs through periodic inspections of trial sponsors, principal investigators and trial sites. If we or the CROs conducting clinical trials of our product candidates fail to comply with applicable GCPs, the clinical data generated in the clinical trials may be deemed unreliable and the FDA may require additional clinical trials before approving any marketing applications.

If any relationships with CROs terminate, we or our collaborators may not be able to enter into arrangements with alternative CROs. In addition, these third-party CROs are not our employees, and we cannot control whether or not they devote sufficient time and resources to our on-going clinical programs or perform trials efficiently. These CROs may also have relationships with other commercial entities, including our competitors, for whom they may also be conducting clinical studies or other drug development activities, which could harm our competitive position. If CROs do not successfully carry out their contractual duties or obligations or meet expected deadlines, if they need to be replaced, or if the quality or accuracy of the clinical data they obtain is compromised due to the failure to adhere to our clinical protocols, regulatory requirements, or for other reasons, our clinical trials may be extended, delayed or terminated, and we may not be able to obtain regulatory approval for or successfully commercialize our product candidates. As a result, our financial results and the commercial prospects for our product candidates would be harmed, our costs could increase and our ability to generate revenues could be delayed. Cost overruns by or disputes with our CROs may significantly increase our expenses.

Even if our products receive regulatory approval, they may still face future development and regulatory difficulties.

Even if United States regulatory approval is obtained, the FDA may still impose significant restrictions on a product's indicated uses or marketing or impose ongoing requirements for potentially costly post-approval studies. This governmental oversight may be particularly strict with respect to gene-based therapies. Our products will also be subject to ongoing FDA requirements governing the labeling, packaging, storage, advertising, promotion, record keeping and submission of safety and other post-market information. For example, the FDA strictly regulates the promotional claims that may be made about medical products. In particular, a product may not be promoted for uses that are not approved by the FDA as reflected in the product's approved labeling. However, companies may in certain circumstances share truthful and not misleading information that is otherwise consistent with the product's FDA approved labeling. In addition, manufacturers of drug products and their facilities are subject to continual review and periodic inspections by the FDA and other regulatory authorities for compliance with current good manufacturing practices, or cGMP, regulations. If we or a regulatory agency discover previously unknown problems with a product, such as adverse events of unanticipated severity or frequency, or problems with the facility where the product is manufactured, a regulatory agency may impose restrictions on that product, the manufacturer or us, including requiring withdrawal of the product from the market or suspension of manufacturing. If we, our product candidates or the manufacturing facilities for our product candidates fail to comply with applicable regulatory requirements, a regulatory agency may:

- issue Warning Letters or untitled letters;
- impose civil or criminal penalties;
- suspend regulatory approval;
- suspend any ongoing clinical trials;
- refuse to approve pending applications or supplements to applications filed by us;
- impose restrictions on operations, including costly new manufacturing requirements; or
- seize or detain products or require us to initiate a product recall.

Even if our products receive regulatory approval in the United States, we may never receive approval or commercialize our products outside of the United States.

In order to market any electroporation equipment and product candidates outside of the United States, we must establish and comply with numerous and varying regulatory requirements of other countries regarding safety and efficacy. Approval procedures vary among countries and can involve additional product testing and additional administrative review periods. The time required to obtain approval in other countries might differ from that required to obtain FDA approval. The regulatory approval process in other countries may include all of the risks detailed above regarding FDA approval in the United States as well as other risks. Regulatory approval in one country does not ensure regulatory approval in another, but a failure or delay in obtaining regulatory approval in one country may have a negative effect on the regulatory process in others. Failure to obtain regulatory approval in other countries or any delay or setback in obtaining such approval could have the same adverse effects detailed above regarding FDA approval in the United States. Such effects include the risks that our product candidates may not

be approved for all indications requested, which could limit the uses of our product candidates and have an adverse effect on their commercial potential or require costly, post-marketing follow-up studies.

We face potential product liability exposure and, if successful claims are brought against us, we may incur substantial liability.

The use of our electroporation equipment and synthetic vaccine candidates in clinical trials and the sale of any products for which we obtain marketing approval expose us to the risk of product liability claims. Product liability claims might be brought against us by consumers, healthcare providers, pharmaceutical companies or others selling or otherwise coming into contact with our products. For example, pharmaceutical companies have been subject to claims that the use of some pediatric vaccines has caused personal injuries, including brain damage, central nervous system damage and autism, and these companies have incurred material costs to defend these claims. If we cannot successfully defend ourselves against product liability claims, we could incur substantial liabilities. In addition, regardless of merit or eventual outcome, product liability claims may result in:

- decreased demand for our product candidates;
- impairment of our business reputation;
- withdrawal of clinical trial participants;
- costs of related litigation;
- distraction of management's attention from our primary business;
- substantial monetary awards to patients or other claimants;
- loss of revenues; and
- inability to commercialize our products.

We have obtained product liability insurance coverage for our clinical trials, but our insurance coverage may not be sufficient to reimburse us for any expenses or losses we may suffer. Moreover, insurance coverage is becoming increasingly expensive, and, in the future, we may not be able to maintain insurance coverage at a reasonable cost or in sufficient amounts to protect us against losses due to liability. On occasion, large judgments have been awarded in class action lawsuits based on products that had unanticipated side effects. A successful product liability claim or series of claims brought against us could cause our stock price to decline and, if judgments exceed our insurance coverage, could adversely affect our business.

We currently have no marketing and sales organization. If we are unable to establish marketing and sales capabilities or enter into agreements with third parties to market and sell our products, we may not be able to generate product revenues.

We currently do not have a sales organization for the marketing, sales and distribution of our electroporation equipment and product candidates. In order to commercialize any products, we must build our marketing, sales, distribution, managerial and other non-technical capabilities or make arrangements with third parties to perform these services. We contemplate establishing our own sales force or seeking third-party partners to sell our products. The establishment and development of our own sales force to market any products we may develop will be expensive and time consuming and could delay any product launch, and we may not be able to successfully develop this capability. We will also have to compete with other pharmaceutical and biotechnology companies to recruit, hire, train and retain marketing and sales personnel. To the extent we rely on third parties to commercialize our approved products, if any, we will receive lower revenues than if we commercialized these products ourselves. In addition, we may have little or no control over the sales efforts of third parties involved in our commercialization efforts. In the event we are unable to develop our own marketing and sales force or collaborate with a third-party marketing and sales organization, we would not be able to commercialize our product candidates which would negatively impact our ability to generate product revenues.

If any of our products for which we receive regulatory approval does not achieve broad market acceptance, the revenues that we generate from their sales will be limited.

The commercial success of our electroporation equipment and product candidates for which we obtain marketing approval from the FDA or other regulatory authorities will depend upon the acceptance of these products by both the medical community and patient population. Coverage and reimbursement of our product candidates by third-party payors, including government payors, generally is also necessary for optimal commercial success. The degree of market acceptance of any of our approved products will depend on a number of factors, including:

- our ability to provide acceptable evidence of safety and efficacy;
- the relative convenience and ease of administration;

- the prevalence and severity of any actual or perceived adverse side effects;
- limitations or warnings contained in a product's FDA-approved labeling, including, for example, potential “black box” warnings
- availability of alternative treatments;
- pricing and cost effectiveness;
- the effectiveness of our or any future collaborators' sales and marketing strategies;
- our ability to obtain sufficient third-party coverage and adequate reimbursement; and
- the willingness of patients to pay out of pocket in the absence of third-party coverage.

If our electroporation equipment and product candidates are approved but do not achieve an adequate level of acceptance by physicians, healthcare payors and patients, we may not generate sufficient revenue from these products, and we may not become or remain profitable. In addition, our efforts to educate the medical community and third-party payors on the benefits of our product candidates may require significant resources and may never be successful.

We are subject to uncertainty relating to coverage and reimbursement policies which, if not favorable to our product candidates, could hinder or prevent our products' commercial success.

Patients in the United States and elsewhere generally rely on third-party payors to reimburse part or all of the costs associated with their prescription drugs and medical treatments. Accordingly, our ability to commercialize our electroporation equipment and product candidates successfully will depend in part on the extent to which governmental authorities, including Medicare and Medicaid, private health insurers and other third-party payors establish appropriate coverage and reimbursement levels for our product candidates and related treatments. As a threshold for coverage and reimbursement, third-party payors generally require that drug products have been approved for marketing by the FDA.

Significant uncertainty exists as to the coverage and reimbursement status of any products for which we may obtain regulatory approval. Coverage decisions may not favor new products when more established or lower cost therapeutic alternatives are already available. Even if we obtain coverage for a given product, the associated reimbursement rate may not be adequate to cover our costs, including research, development, intellectual property, manufacture, sale and distribution expenses, or may require co-payments that patients find unacceptably high. Patients are unlikely to use our products unless reimbursement is adequate to cover all or a significant portion of the cost of our drug products.

Additionally, some of our products, if approved, will be provided under the supervision of a physician. When used in connection with medical procedures, our product candidates may not be reimbursed separately but their cost may instead be bundled as part of the payment received by the provider for the procedure only. Separate reimbursement for the product itself or the treatment or procedure in which our product is used may not be available. A decision by a third-party payor not to cover or separately reimburse for our product candidates or procedures using our product candidates, could reduce physician utilization of our products once approved.

Coverage and reimbursement policies for drug products can differ significantly from payor to payor as there is no uniform policy of coverage and reimbursement for drug products among third-party payors in the United States. There may be significant delays in obtaining coverage and reimbursement as the process of determining coverage and reimbursement is often time consuming and costly which will require us to provide scientific and clinical support for the use of our products to each payor separately, with no assurance that coverage or adequate reimbursement will be obtained. It is difficult to predict at this time what government authorities and third-party payors will decide with respect to coverage and reimbursement for our products.

A significant trend in the U.S. healthcare industry and elsewhere is cost containment. Third-party payors have attempted to control costs by limiting coverage and the amount of reimbursement for particular products and services. Third-party payors are increasingly challenging the effectiveness of and prices charged for medical products and services. Moreover, the U.S. government, state legislatures and foreign governmental entities have shown significant interest in implementing cost containment programs to limit the growth of government paid healthcare costs, including price controls, restrictions on reimbursement and coverage and requirements for substitution of generic products for branded prescription drugs. We may not be able to obtain third-party payor coverage or reimbursement for our products in whole or in part.

Healthcare reform measures could hinder or prevent our products' commercial success.

In both the United States and certain foreign jurisdictions there have been, and we anticipate there will continue to be, a number of legislative and regulatory changes to the healthcare system that could impact our ability to sell any of our products profitably. In the United States, the federal government enacted healthcare reform legislation, the Patient Protection and Affordable Care Act, as amended by the Health Care and Education Reconciliation Act, or collectively, the ACA. Among the ACA's provisions of importance to the pharmaceutical industry are that it:

- imposed an annual excise tax of 2.3% on any entity that manufactures or imports medical devices offered for sale in the United States, with limited exceptions, although the effective rate paid may be lower. Under the Consolidated Appropriations Act of 2016, the excise tax was suspended through December 31, 2017, and under the continuing resolution on appropriations for fiscal year 2018, or 2018 Appropriations Resolution, signed by President Trump on January 22, 2018, was further suspended through December 31, 2019;
- created an annual, nondeductible fee on any entity that manufactures or imports certain specified branded prescription drugs and biologic agents apportioned among these entities according to their market share in some government healthcare programs;
- increased the statutory minimum rebates a manufacturer must pay under the Medicaid Drug Rebate Program, to 23.1% and 13% of the average manufacturer price for most branded and generic drugs, respectively and capped the total rebate amount for innovator drugs at 100% of the Average Manufacturer Price, or AMP;
- created new methodology by which rebates owed by manufacturers under the Medicaid Drug Rebate Program are calculated for certain drugs and biologics that are inhaled, infused, instilled, implanted or injected;
- expanded eligibility criteria for Medicaid programs by, among other things, allowing states to offer Medicaid coverage to additional individuals and by adding new mandatory eligibility categories for individuals with income at or below 133% of the federal poverty level, thereby potentially increasing manufacturers' Medicaid rebate liability;
- expanded the entities eligible for discounts under the Public Health program;
- created a new Patient-Centered Outcomes Research Institute to oversee, identify priorities in, and conduct comparative clinical effectiveness research, along with funding for such research;
- established a Center for Medicare & Medicaid Innovation at the Centers for Medicare & Medicaid Services, or CMS, to test innovative payment and service delivery models to lower Medicare and Medicaid spending, potentially including prescription drug spending that began on January 1, 2011; and
- created a licensure framework for follow on biologic products.

Some of the provisions of the ACA have yet to be implemented, and there have been judicial and Congressional challenges to certain aspects of the ACA, as well as recent efforts by the Trump administration to repeal or replace certain aspects of the ACA. Since January 2017, President Trump has signed two Executive Orders and other directives designed to delay the implementation of certain provisions of the ACA. Concurrently, Congress has considered legislation that would repeal or replace all or part of the ACA. While Congress has not passed comprehensive repeal legislation, it has enacted laws that modify certain provisions of the ACA such as removing penalties, starting January 1, 2019, for not complying with the ACA's individual mandate to carry health insurance and delaying the implementation of certain ACA-mandated fees. On December 14, 2018, a Texas U.S. District Court Judge ruled that the ACA is unconstitutional in its entirety because the "individual mandate" was repealed by Congress as part of the Tax Cuts and Jobs Act of 2017. While the Texas U.S. District Court Judge, as well as the Trump administration and CMS, have stated that the ruling will have no immediate effect pending appeal of the decision, it is unclear how this decision, subsequent appeals, and other efforts to repeal and replace the ACA will impact the ACA and our business.

In addition, other legislative changes have been proposed and adopted since the ACA was enacted. On August 2, 2011, the Budget Control Act of 2011 was signed into law, which, among other things, included reductions to Medicare payments to providers of 2% per fiscal year, which went into effect on April 1, 2013 and, due to subsequent legislative amendments to the statute will remain in effect through 2027 unless additional Congressional action is taken. On January 2, 2013, the American Taxpayer Relief Act of 2012 was signed into law, which, among other things, reduced Medicare payments to several providers, including hospitals, and increased the statute of limitations period for the government to recover overpayments to providers from three to five years.

Further there has been heightened governmental scrutiny in the United States of pharmaceutical pricing practices in light of the rising cost of prescription drugs and biologics. Such scrutiny has resulted in several recent congressional inquiries and proposed and enacted federal and state legislation designed to, among other things, bring more transparency to product pricing, review the relationship between pricing and manufacturer patient programs, and reform government program reimbursement methodologies for products. For example, the Trump administration released a "Blueprint" to lower drug prices and reduce out of pocket costs of drugs that contains additional proposals to increase drug manufacturer competition, increase the negotiating power of certain federal healthcare programs, incentivize manufacturers to lower the list price of their products, and reduce the out of pocket costs of drug products paid by consumers. On January 31, 2019, the U.S. Department of Health and Human Services, Office of Inspector General, proposed modifications to the federal healthcare program Anti-Kickback Statute discount safe harbor for the purpose of reducing the cost of drug products to consumers which, among other things, if finalized, will affect discounts paid by manufacturers to Medicare Part D plans, Medicaid managed care organizations and pharmacy benefit managers working with these organizations. While some of these and other proposed measures may require additional

authorization to become effective, Congress and the Trump administration have each indicated that it will continue to seek new legislative and/or administrative measures to control drug costs.

The continuing efforts of the government, insurance companies, managed care organizations and other payors of healthcare services to make and implement healthcare reforms may adversely affect:

- our ability to set a price we believe is fair for our products;
- our ability to generate revenues and achieve or maintain profitability;
- the availability of capital; and
- our ability to obtain timely approval of our products.

If we fail to comply with applicable healthcare regulations, we could face substantial penalties and our business, operations and financial condition could be adversely affected.

Certain federal, state, local and foreign healthcare laws and regulations pertaining to fraud and abuse, transparency, patients' rights, and privacy are applicable to our business. The laws that may affect our ability to operate include:

- the federal healthcare program Anti-Kickback Statute, which prohibits, among other things, people from soliciting, receiving or providing remuneration, directly or indirectly, to induce or reward either the referral of an individual, or ordering, or leasing of an item, good, facility or service, for which payment may be made by a federal healthcare program such as Medicare or Medicaid. The intent standard under the federal healthcare program Anti-Kickback Statute was amended by the ACA to a stricter standard such that a person or entity does not need to have actual knowledge of the statute or specific intent to violate it in order to have committed a violation. Further, the ACA codified case law that a claim including items or services resulting from a violation of the federal healthcare program Anti-Kickback Statute constitutes a false or fraudulent claim for purposes of the civil False Claims Act;
- federal civil and criminal false claims laws, including the civil False Claims Act, which prohibit, among other things, individuals or entities from knowingly presenting, or causing to be presented, claims for payment from Medicare, Medicaid, or other third-party payors that are false or fraudulent;
- the federal Health Insurance Portability and Accountability Act of 1996, or HIPAA, which prohibits, among other things, executing a scheme to defraud any healthcare benefit program or making false statements relating to healthcare matters. Similar to the federal healthcare program Anti-Kickback Statute, a person or entity does not need to have actual knowledge of the statute or specific intent to violate it in order to have committed a violation;
- HIPAA, as amended by the Health Information Technology for Economic and Clinical Health Act, and their implementing regulations, which imposes certain requirements relating to the privacy, security and transmission of individually identifiable health information on certain individuals and entities;
- the Physician Payments Sunshine Act, created under the ACA, which requires pharmaceutical companies to record any transfers of value made to doctors and teaching hospitals, as well as ownership and investment interests held by physicians and their immediate family members, and to annually report such data to CMS;
- the Federal Food, Drug, and Cosmetic Act, which among other things, strictly regulates drug product marketing, prohibits manufacturers from marketing drug products for off-label use and regulates the distribution of drug samples;
- the U.S. Foreign Corrupt Practices Act, which, among other things, prohibits companies issuing stock in the U.S. from bribing foreign officials for government contracts and other business;
- state law equivalents of each of the above federal laws, such as anti-kickback and false claims laws which may apply to items or services reimbursed by any third-party payor, including commercial insurers, state and local laws requiring the registration of pharmaceutical sales and medical representatives, and state laws governing the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways and often are not preempted by HIPAA, thus complicating compliance efforts; and
- additional state and local laws such as laws in California and Massachusetts, which mandate implementation of compliance programs, compliance with industry ethics codes, and spending limits, and other state and local laws, such as laws in Vermont, Maine, and Minnesota which require reporting to state governments of gifts, compensation, and other remuneration to physicians.

The shifting regulatory environment, along with the requirement to comply with multiple jurisdictions with different compliance and/or reporting requirements, increases the possibility that a company may run afoul of one or more laws.

We will be required to spend substantial time and money to ensure that our business arrangements with third parties comply with applicable healthcare laws and regulations. Because of the breadth of these laws and the narrowness of the statutory exceptions and regulatory safe harbors available, which require strict compliance in order to offer protection, it is possible that governmental authorities may conclude that our business practices do not comply with current or future statutes, regulations, agency guidance or case law involving applicable healthcare laws. If our operations are found to be in violation of any of the laws described above or any other governmental regulations that apply to us, we may be subject to significant penalties, including administrative, civil and criminal penalties, damages, fines, disgorgement, possible exclusion from participation in Medicare, Medicaid and other federal healthcare programs, imprisonment, integrity and/or other oversight obligations, contractual damages, reputational harm, and the curtailment or restructuring of our operations. Any such penalties could adversely affect our ability to operate our business and our financial results. Any action against us for violation of these laws, even if we successfully defend against it, could cause us to incur significant legal expenses and divert our management's attention from the operation of our business.

If we and the contract manufacturers upon whom we rely fail to produce our systems and product candidates in the volumes that we require on a timely basis, or fail to comply with stringent regulations, we may face delays in the development and commercialization of our electroporation equipment and product candidates.

We manufacture some components of our electroporation systems and utilize the services of contract manufacturers to manufacture the remaining components of these systems and our product supplies for clinical trials. The manufacture of our systems and product supplies requires significant expertise and capital investment, including the development of advanced manufacturing techniques and process controls. Manufacturers often encounter difficulties in production, particularly in scaling up for commercial production. These problems include difficulties with production costs and yields, quality control, including stability of the equipment and product candidates and quality assurance testing, shortages of qualified personnel, as well as compliance with strictly enforced federal, state and foreign regulations. If we or our manufacturers were to encounter any of these difficulties or our manufacturers otherwise fail to comply with their obligations to us, our ability to provide our electroporation equipment to our partners and products to patients in our clinical trials or to commercially launch a product would be jeopardized. Any delay or interruption in the supply of clinical trial supplies could delay the completion of our clinical trials, increase the costs associated with maintaining our clinical trial program and, depending upon the period of delay, require us to commence new trials at significant additional expense or terminate the trials completely.

In addition, all manufacturers of our products must comply with cGMP requirements enforced by the FDA through its facilities inspection program. These requirements include, among other things, quality control, quality assurance and the generation and maintenance of records and documentation. Manufacturers of our products may be unable to comply with these cGMP requirements and with other FDA, state and foreign regulatory requirements. We have little control over our manufacturers' compliance with these regulations and standards. A failure to comply with these requirements may result in fines and civil penalties, suspension of production, suspension or delay in product approval, product seizure or recall, or withdrawal of product approval. If the safety of any product is compromised due to our or our manufacturers' failure to adhere to applicable laws or for other reasons, we may not be able to obtain regulatory approval for or successfully commercialize our products, and we may be held liable for any injuries sustained as a result. Any of these factors could cause a delay of clinical trials, regulatory submissions, approvals or commercialization of our products, entail higher costs or result in our being unable to effectively commercialize our products. Furthermore, if our manufacturers fail to deliver the required commercial quantities on a timely basis, pursuant to provided specifications and at commercially reasonable prices, we may be unable to meet demand for our products and would lose potential revenues.

Our failure to successfully acquire, develop and market additional product candidates or approved products would impair our ability to grow.

We may acquire, in-license, develop and/or market additional products and product candidates. The success of these actions depends partly upon our ability to identify, select and acquire promising product candidates and products.

The process of proposing, negotiating and implementing a license or acquisition of a product candidate or approved product is lengthy and complex. Other companies, including some with substantially greater financial, marketing and sales resources, may compete with us for the license or acquisition of product candidates and approved products. We have limited resources to identify and execute the acquisition or in-licensing of third-party products, businesses and technologies and integrate them into our current infrastructure. Moreover, we may devote resources to potential acquisitions or in-licensing opportunities that are never completed, or we may fail to realize the anticipated benefits of such efforts. We may not be able to acquire the rights to additional product candidates on terms that we find acceptable, or at all.

In addition, future acquisitions may entail numerous operational and financial risks, including:

- exposure to unknown liabilities;

- disruption of our business and diversion of our management's time and attention to develop acquired products or technologies;
- incurrence of substantial debt or dilutive issuances of securities to pay for acquisitions;
- higher than expected acquisition and integration costs;
- increased amortization expenses;
- difficulty and cost in combining the operations and personnel of any acquired businesses with our operations and personnel;
- impairment of relationships with key suppliers or customers of any acquired businesses due to changes in management and ownership; and
- inability to retain key employees of any acquired businesses.

Further, any product candidate that we acquire may require additional development efforts prior to commercial sale, including extensive clinical testing and approval by the FDA and applicable foreign regulatory authorities. All product candidates are prone to risks of failure typical of product development, including the possibility that a product candidate will not be shown to be sufficiently safe and effective for approval by regulatory authorities.

Our business involves the use of hazardous materials and we and our third-party manufacturers must comply with environmental laws and regulations, which can be expensive and restrict how we do business.

Our and our third-party manufacturers' activities involve the controlled storage, use and disposal of hazardous materials, including the components of our product candidates and other hazardous compounds. We and our manufacturers are subject to federal, state and local laws and regulations governing the use, manufacture, storage, handling and disposal of these hazardous materials. In the event of an accident, state or federal authorities may curtail the use of these materials and interrupt our business operations. If we are subject to any liability as a result of our or our third-party manufacturers' activities involving hazardous materials, our business and financial condition may be adversely affected.

We may be subject to stockholder litigation, which would harm our business and financial condition.

We may have actions brought against us by stockholders relating to past transactions, changes in our stock price or other matters. Any such actions could give rise to substantial damages, and thereby have a material adverse effect on our consolidated financial position, liquidity, or results of operations. Even if an action is not resolved against us, the uncertainty and expense associated with stockholder actions could harm our business, financial condition and reputation. Litigation can be costly, time-consuming and disruptive to business operations. The defense of lawsuits could also result in diversion of our management's time and attention away from business operations, which could harm our business.

Our results of operations and liquidity needs could be materially affected by market fluctuations and general economic conditions.

Our results of operations could be materially affected by economic conditions generally, both in the United States and elsewhere around the world. Concerns over inflation, energy costs, geopolitical issues, global pathogen outbreaks or pandemics, and the availability and cost of credit have in the past and may continue to contribute to increased volatility and diminished expectations for the economy and the markets going forward. Market upheavals may have an adverse effect on us. In the event of a market downturn, our results of operations could be adversely affected. Our future cost of equity or debt capital and access to the capital markets could be adversely affected, and our stock price could decline. There may be disruption in or delay in the performance of our third-party contractors and suppliers. If our contractors, suppliers and partners are unable to satisfy their contractual commitments, our business could suffer. In addition, we maintain significant amounts of cash and cash equivalents at one or more financial institutions that are in excess of federally insured limits, and we may experience losses on these deposits.

We are dependent on information technology and our systems and infrastructure face certain risks, including from cybersecurity breaches and data leakage.

We rely to a large extent upon sophisticated information technology systems to operate our businesses, some of which are managed, hosted provided and/or used for third-parties or their vendors. We collect, store and transmit large amounts of confidential information, and we deploy and operate an array of technical and procedural controls to maintain the confidentiality and integrity of such confidential information. A significant breakdown, invasion, corruption, destruction or interruption of critical information technology systems or infrastructure, by our workforce, others with authorized access to our systems or unauthorized persons could negatively impact operations. The ever-increasing use and evolution of technology, including cloud-based computing, creates

opportunities for the unintentional dissemination or intentional destruction of confidential information stored in our or our third-party providers' systems, portable media or storage devices. We could also experience a business interruption, theft of confidential information or reputational damage from industrial espionage attacks, malware or other cyber-attacks, which may compromise our system infrastructure or lead to data leakage, either internally or at our third-party providers. While we have invested in the protection of data and information technology, there can be no assurance that our efforts will prevent service interruptions or security breaches. Any such interruption or breach of our systems could adversely affect our business operations and/or result in the loss of critical or sensitive confidential information or intellectual property, and could result in financial, legal, business and reputational harm to us.

Changes in tax laws could adversely affect our business and financial condition.

On December 22, 2017, President Trump signed into law new legislation, known as the Tax Cuts and Jobs Act of 2017, that significantly revised the Internal Revenue Code of 1986, as amended, or the Code. The new federal income tax law, among other things, contains significant changes to corporate taxation, including reduction of the corporate tax rate from a top marginal rate of 35 percent to a flat rate of 21 percent, limitation of the tax deduction for interest expense to 30 percent of adjusted earnings (except for certain small businesses), limitation of the deduction for net operating losses to 80 percent of current-year taxable income and elimination of net operating loss carrybacks, one time taxation of offshore earnings at reduced rates regardless of whether they are repatriated, immediate deductions for certain new investments instead of deductions for depreciation expense over time, and modifying or repealing many business deductions and credits (including reducing the business tax credit for certain clinical testing expenses incurred in the testing of certain drugs for rare diseases or conditions). Notwithstanding the reduction in the corporate income tax rate, the overall impact of the federal tax law is uncertain and our business and financial condition could be adversely affected. In addition, it is uncertain if and to what extent various states will conform to the federal tax law.

Changes in funding for the FDA and other government agencies could hinder our ability to hire and retain key leadership and other personnel, or otherwise prevent new products from being developed or commercialized in a timely manner, which could negatively impact our business.

The ability of the FDA to review and approve new products can be affected by a variety of factors, including government budget and funding levels, ability to hire and retain key personnel and accept the payment of user fees, and statutory, regulatory, and policy changes. Average review times at the agency have fluctuated in recent years as a result. In addition, government funding of other government agencies that fund research and development activities is subject to the political process, which is inherently fluid and unpredictable.

Disruptions at the FDA and other agencies may also slow the time necessary for new drugs to be reviewed and/or approved by necessary government agencies, which would adversely affect our business. For example, over the last several years, including for 35 days beginning on December 22, 2018, the U.S. government has shut down several times and certain regulatory agencies, such as the FDA, have had to furlough critical FDA employees and stop critical activities. If a prolonged government shutdown occurs, it could significantly impact the ability of the FDA to timely review and process our regulatory submissions, which could have a material adverse effect on our business.

The coronavirus outbreak could adversely impact our business.

In December 2019, it was first reported that there had been an outbreak of a novel strain of coronavirus, SARS-CoV-2, in China. The coronavirus has since spread to a number of other countries, including countries in which we have planned or ongoing clinical trials. The number of cases globally is increasing daily and in an effort to halt the outbreak, many governments, including the Chinese government, and many business have placed significant restrictions on travel and closed businesses. Two of our collaborators, ApolloBio and Beijing Advaccine, are based in China and their operations, including development of VGX-3100 and INO-4800, could be adversely impacted by the restrictions on travel and business disruptions.

As the coronavirus continues to spread outside of China, including throughout the United States, we may experience disruptions that could severely impact our business and clinical trials, including:

- delays or difficulties in enrolling patients in certain of our clinical trials;
- delays or difficulties in clinical site initiation, including difficulties in recruiting clinical site investigators and clinical site staff;
- diversion of healthcare resources away from the conduct of certain of our clinical trials, including the diversion of hospitals serving as our clinical trial sites and hospital staff supporting the conduct of certain of our clinical trials;
- interruption of key clinical trial activities, such as clinical trial site monitoring, due to limitations on travel imposed or recommended by federal or state governments, employers and others; and

- limitations in employee resources that would otherwise be focused on the conduct of our clinical trials, including because of sickness of employees or their families or the desire of employees to avoid contact with large groups of people.

The global outbreak of coronavirus continues to rapidly evolve. The extent to which the coronavirus impacts our results will depend on future developments, which are highly uncertain and cannot be predicted, including new information which may emerge concerning the severity of the coronavirus, the ultimate geographic spread of the coronavirus, the duration of the outbreak, travel restrictions imposed by China and other countries, business closures or business disruption in China and other countries, a reduction in time spent out of home and the actions taken throughout the world, including in our markets, to contain the coronavirus or treat its impact.

Risks Related to Our Intellectual Property

It is difficult and costly to generate and protect our intellectual property and our proprietary technologies, and we may not be able to ensure their protection.

Our commercial success will depend in part on obtaining and maintaining patent, trademark, trade secret, and other intellectual property protection relating to our electroporation equipment and product candidates, as well as successfully defending these intellectual property rights against third-party challenges.

The patent positions of pharmaceutical and biotechnology companies can be highly uncertain and involve complex legal and factual questions for which important legal principles remain unresolved. The laws and regulations regarding the breadth of claims allowed in biotechnology patents have evolved over recent years and continues to undergo review and revision, both in the United States and abroad. The biotechnology patent situation outside the United States can be even more uncertain depending on the country. Changes in either the patent laws or in interpretations of patent laws in the United States and other countries may diminish the value of our intellectual property. Accordingly, we cannot predict the breadth of claims that may be allowed or enforced in our licensed patents, our patents or in third-party patents, nor can we predict the likelihood of our patents surviving a patent validity challenge.

The degree of future protection for our intellectual property rights is uncertain, because legal decision-making can be unpredictable, thereby often times resulting in limited protection, which may not adequately protect our rights or permit us to gain or keep our competitive advantage, or resulting in an invalid or unenforceable patent. For example:

- we, or the parties from whom we have acquired or licensed patent rights, may not have been the first to file the underlying patent applications or the first to make the inventions covered by such patents;
- the named inventors or co-inventors of patents or patent applications that we have licensed or acquired may be incorrect, which may give rise to inventorship and ownership challenges;
- others may develop similar or alternative technologies, or duplicate any of our products or technologies that may not be covered by our patents, including design-arounds;
- pending patent applications may not result in issued patents;
- the issued patents covering our products and technologies may not provide us with any competitive advantages or have any commercial value;
- the issued patents may be challenged and invalidated, or rendered unenforceable;
- the issued patents may be subject to reexamination, which could result in a narrowing of the scope of claims or cancellation of claims found unpatentable;
- we may not develop or acquire additional proprietary technologies that are patentable;
- our trademarks may be invalid or subject to a third party's prior use; or
- our ability to enforce our patent rights will depend on our ability to detect infringement, and litigation to enforce patent rights may not be pursued due to significant financial costs, diversion of resources, and unpredictability of a favorable result or ruling.

We depend, in part, on our licensors and collaborators to protect a portion of our intellectual property rights. In such cases, our licensors and collaborators may be primarily or wholly responsible for the maintenance of patents and prosecution of patent applications relating to important areas of our business. If any of these parties fail to adequately protect these products with issued patents, our business and prospects would be harmed significantly.

We also may rely on trade secrets to protect our technology, especially where we do not believe patent protection is appropriate or obtainable. However, trade secrets are difficult to protect. Although we use reasonable efforts to protect our trade secrets, our employees, consultants, contractors, outside scientific collaborators and other advisors may unintentionally or

willfully disclose our trade secrets to competitors. Enforcing a claim that a third-party entity illegally obtained and is using any of our trade secrets is expensive and time consuming, and the outcome is unpredictable. In addition, courts outside the United States are sometimes less willing to protect trade secrets. Moreover, our competitors may independently develop equivalent knowledge, methods and know-how.

If we or our licensors fail to obtain or maintain patent protection or trade secret protection for our product candidates or our technologies, third parties could use our proprietary information, which could impair our ability to compete in the market and adversely affect our ability to generate revenues and attain profitability.

From time to time, U.S. and other policymakers have proposed reforming the patent laws and regulations of their countries. In September 2011 the America Invents Act (the Act) was signed into law. The Act changed the current “first-to-invent” system to a system that awards a patent to the “first-inventor-to-file” for an application for a patentable invention. The Act also created a procedure to challenge newly issued patents in the patent office via post-grant proceedings and new inter parties reexamination proceedings. These changes may make it easier for competitors to challenge our patents, which could result in increased competition and have a material adverse effect on our product sales, business and results of operations. The changes may also make it harder to challenge third-party patents and place greater importance on being the first inventor to file a patent application on an invention.

If we are sued for infringing intellectual property rights of third parties, it will be costly and time consuming, and an unfavorable outcome in that litigation would have a material adverse effect on our business.

Other companies may have or may acquire intellectual property rights that could be enforced against us. If they do so, we may be required to alter our technologies, pay licensing fees or cease activities. If our products or technologies infringe the intellectual property rights of others, they could bring legal action against us or our licensors or collaborators claiming damages and seeking to enjoin any activities that they believe infringe their intellectual property rights.

Because patent applications can take many years to issue, and there is a period when the application remains undisclosed to the public, there may be currently pending applications unknown to us or reissue applications that may later result in issued patents upon which our products or technologies may infringe. There could also be existing patents of which we are unaware that our products or technologies may infringe. In addition, if third parties file patent applications or obtain patents claiming products or technologies also claimed by us in pending applications or issued patents, we may have to participate in interference or derivation proceedings in the United States Patent and Trademark Office to determine priority or derivation of the invention. If third parties file oppositions in foreign countries, we may also have to participate in opposition proceedings in foreign tribunals to defend the patentability of our filed foreign patent applications.

If a third party claims that we infringe its intellectual property rights, it could cause our business to suffer in a number of ways, including:

- we may become involved in time-consuming and expensive litigation, even if the claim is without merit, the third party's patent is invalid or we have not infringed;
- we may become liable for substantial damages for past infringement if a court decides that our technologies infringe upon a third party's patent;
- we may be enjoined by a court to stop making, selling or licensing our products or technologies without a license from a patent holder, which may not be available on commercially acceptable terms, if at all, or which may require us to pay substantial royalties or grant cross-licenses to our patents; and
- we may have to redesign our products so that they do not infringe upon others' patent rights, which may not be possible or could require substantial investment or time.

If any of these events occur, our business could suffer and the market price of our common stock may decline.

Risks Related to Our Common Stock

An active trading market for our common stock may not be sustained.

Although our common stock is listed on the Nasdaq Global Select Market, we cannot assure you that an active trading market for our shares will continue to be sustained. If an active market for our common stock is not sustained, it may be difficult for investors in our common stock to sell shares without depressing the market price for the shares or to sell the shares at all.

The price of our common stock may be volatile, and an investment in our common stock could decline substantially in value.

In light of our small size and limited resources, as well as the uncertainties and risks that can affect our business and industry, our stock price may be highly volatile and can be subject to substantial drops, with or even in the absence of news affecting our business. Period to period comparisons are not indicative of future performance. The following factors, in addition to the other risk factors described in this annual report, and the potentially low volume of trades in our common stock, may have a significant impact on the market price of our common stock, some of which are beyond our control:

- developments concerning any research and development, clinical trials, manufacturing, and marketing efforts or collaborations;
- fluctuating public or scientific interest in the potential for influenza pandemic or other applications for our vaccine or other product candidates;
- our announcement of significant acquisitions, strategic collaborations, joint ventures or capital commitments;
- fluctuations in our operating results;
- announcements of technological innovations;
- new products or services that we or our competitors offer;
- changes in the structure of healthcare payment systems;
- the initiation, conduct and/or outcome of intellectual property and/or litigation matters;
- changes in financial or other estimates by securities analysts or other reviewers or evaluators of our business;
- conditions or trends in bio-pharmaceutical or other healthcare industries;
- regulatory developments in the United States and other countries;
- negative perception of gene-based therapy;
- changes in the economic performance and/or market valuations of other biotechnology and medical device companies;
- additions or departures of key personnel;
- sales or other transactions involving our common stock;
- changes in our capital structure;
- sales or other transactions by executive officers or directors involving our common stock;
- changes in accounting principles;
- global unrest, terrorist activities, and economic and other external factors; and
- catastrophic weather and/or global disease pandemics, such as the recent coronavirus outbreak.

The stock market in general has recently experienced relatively large price and volume fluctuations, particularly in response to the coronavirus outbreak. In particular, the market prices of securities of smaller biotechnology and medical device companies have experienced dramatic fluctuations that often have been unrelated or disproportionate to the operating results of these companies. Continued market fluctuations could result in extreme volatility in the price of the common stock, which could cause a decline in the value of the common stock. In addition, price volatility may increase if the trading volume of our common stock remains limited or declines.

If equity research analysts do not publish research or reports, or publish unfavorable research or reports, about us, our business or our market, our stock price and trading volume could decline.

The trading market for our common stock is influenced by the research and reports that equity research analysts publish about us and our business, and we have limited research coverage by equity research analysts. Equity research analysts may elect not to initiate or continue to provide research coverage of our common stock, and such lack of research coverage may adversely affect the market price of our common stock. Even if we have equity research analyst coverage, we will not have any control over the analysts or the content and opinions included in their reports. The price of our stock could decline if one or

more equity research analysts downgrade our stock or issue other unfavorable commentary or research. If one or more equity research analysts ceases coverage of our company or fails to publish reports on us regularly, demand for our stock could decrease, which in turn could cause our stock price or trading volume to decline.

The issuance of additional stock in connection with financings, acquisitions, investments, our stock incentive plans or otherwise will dilute all other stockholders.

Our certificate of incorporation authorizes us to issue up to 600,000,000 shares of common stock and up to 10,000,000 shares of preferred stock with such rights and preferences as may be determined by our board of directors. Subject to compliance with applicable rules and regulations, we may issue our shares of common stock or securities convertible into our common stock from time to time in connection with a financing, acquisition, investment, our stock incentive plans or otherwise. Any such issuance could result in substantial dilution to our existing stockholders and cause the trading price of our common stock to decline.

Anti-takeover provisions under our charter documents and Delaware law could delay or prevent a change of control which could limit the market price of our common stock.

Our amended and restated certificate of incorporation contains provisions that could delay or prevent a change of control of our company or changes in our board of directors that our stockholders might consider favorable. Some of these provisions include:

- the authority of our board of directors to issue shares of undesignated preferred stock and to determine the rights, preferences and privileges of these shares, without stockholder approval;
- all stockholder actions must be effected at a duly called meeting of stockholders and not by written consent; and
- the elimination of cumulative voting.

In addition, we are governed by the provisions of Section 203 of the Delaware General Corporate Law, which may prohibit certain business combinations with stockholders owning 15% or more of our outstanding voting stock. These and other provisions in our amended and restated certificate of incorporation, amended and restated bylaws and Delaware law could make it more difficult for stockholders or potential acquirers to obtain control of our board of directors or initiate actions that are opposed by the then-current board of directors, including to delay or impede a merger, tender offer or proxy contest involving our company. Any delay or prevention of a change of control transaction or changes in our board of directors could cause the market price of our common stock to decline.

We have never paid cash dividends on our common stock and we do not anticipate paying dividends in the foreseeable future.

We have paid no cash dividends on our common stock to date, and we currently intend to retain our future earnings, if any, to fund the development and growth of our business. In addition, the terms of any future debt or credit facility may preclude or limit our ability to pay any dividends. As a result, capital appreciation, if any, of our common stock will be the sole source of potential gain for the foreseeable future.

We incur significant costs and demands upon management as a result of being a public company.

As a public company listed in the United States, we incur significant legal, accounting and other costs that could negatively affect our financial results. In addition, changing laws, regulations and standards relating to corporate governance and public disclosure, including regulations implemented by the SEC and stock exchanges, may increase legal and financial compliance costs and make some activities more time-consuming. These laws, regulations and standards are subject to varying interpretations and, as a result, their application in practice may evolve over time as new guidance is provided by regulatory and governing bodies. We intend to invest resources to comply with evolving laws, regulations and standards, and this investment may result in increased general and administrative expenses and a diversion of management's time and attention from revenue-generating activities to compliance activities. If notwithstanding our efforts to comply with new laws, regulations and standards, we fail to comply, regulatory authorities may initiate legal proceedings against us and our business may be harmed.

Failure to comply with these rules might also make it more difficult for us to obtain some types of insurance, including director and officer liability insurance, and we might be forced to accept reduced policy limits and coverage or incur substantially higher costs to obtain the same or similar coverage. The impact of these events could also make it more difficult for us to attract and retain qualified persons to serve on our board of directors, on committees of our board of directors or as members of senior management.

ITEM 1B. UNRESOLVED STAFF COMMENTS

None.

ITEM 2. PROPERTIES

We own no real property and have no plans to acquire any real property in the future.

San Diego Leases

In April 2013, we entered into a lease, or the First San Diego Lease, for office space in San Diego, California. The term of the First San Diego Lease commenced on December 1, 2013. The initial term of the First San Diego Lease is ten years, with an option to extend the term by five years, subject to specified conditions. In June 2015, we amended the First San Diego Lease to increase the total leased space to 31,207 square feet and occupy the entire building. The commencement of the amended First San Diego Lease was in January 2016. As of December 31, 2019, rent payments under the First San Diego Lease include base rent with an annual increase of approximately 3 percent, and additional monthly fees to cover our share of certain facility expenses, including utilities, property taxes, insurance and maintenance. We had an option to terminate the First San Diego Lease on December 1, 2019, which we did not exercise.

In October 2016, we entered into an office lease, or the Second San Diego Lease, for a second property in San Diego, California. The total space under the Second San Diego Lease is approximately 51,000 square feet. We are using the facility for office, manufacturing and research and development purposes. The term of the Second San Diego Lease commenced on June 1, 2017. The initial term of the Second San Diego Lease is ten years, with a right to terminate on November 30, 2023, subject to specified conditions.

The base rent adjusts periodically throughout the term of the Second San Diego Lease. As of December 31, 2019, rent payments under the Second San Diego Lease include base rent with an annual increase of approximately 3 percent, and additional monthly fees to cover our share of certain facility expenses, including utilities, property taxes, insurance and maintenance. In addition, we have paid a security deposit of \$95,000.

Plymouth Meeting Lease

In March 2014, we entered into a lease, or the Plymouth Meeting Lease, for our corporate headquarters in Plymouth Meeting, Pennsylvania. We occupied the space in June 2014. The initial term of the Plymouth Meeting Lease was 11.5 years, with a right to extend the term by five years, subject to specified conditions. We use the space for office purposes.

The base rent adjusts periodically throughout the term of the Plymouth Meeting Lease. As of December 31, 2019, rent payments under the Plymouth Meeting Lease include base rent with an annual increase of approximately 2 percent, and additional monthly fees to cover our share of certain facility expenses, including utilities, property taxes, insurance and maintenance. In addition, we have paid a security deposit of \$49,000. In July 2015, we amended the Plymouth Meeting Lease to increase the total leased space to 27,583 square feet.

In June 2017, we entered into another amendment to the Plymouth Meeting Lease to increase the total leased space to 57,361 square feet and extend the lease term through December 31, 2029. In connection with this amendment, we paid the landlord an additional security deposit of \$75,000.

In the fourth quarter of 2019, we entered into two agreements to sublease a total of approximately 13,500 square feet in our Plymouth Meeting headquarters through periods between December 31, 2022 and March 31, 2025.

We believe our current and future planned facilities will be adequate to meet our operating needs for the foreseeable future. Should we need additional space, we believe we will be able to secure additional space at commercially reasonable rates.

ITEM 3. LEGAL PROCEEDINGS

From time to time, we are subject to litigation and claims arising in the ordinary course of business. We are not currently a party to any material legal proceedings and we are not aware of any pending or threatened legal proceeding against us that we believe could have a material adverse effect on our business, operating results, cash flows or financial condition.

ITEM 4. MINE SAFETY DISCLOSURES

Not applicable.

PART II

ITEM 5. MARKET FOR REGISTRANT'S COMMON EQUITY, RELATED STOCKHOLDER MATTERS AND ISSUER PURCHASES OF EQUITY SECURITIES

Market Information

Our common stock, par value \$0.001 per share, began trading on the Nasdaq Global Select Market on September 15, 2014 under the symbol "INO," having previously traded on the NYSE MKT exchange.

As of March 6, 2020, we had approximately 480 common stockholders of record. The actual number of stockholders is greater than this number of record holders and includes stockholders who are beneficial owners but whose shares are held in street name by brokers and other nominees. This number of holders of record also does not include stockholders whose shares may be held in trust by other entities.

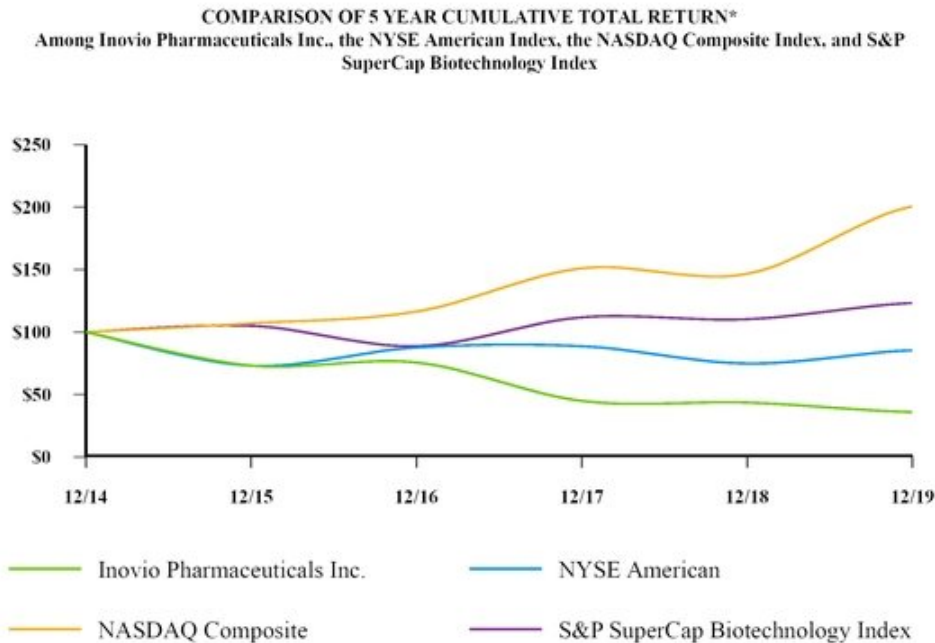

The closing price per share of our common stock on March 6, 2020 was \$14.09, as reported on the Nasdaq Global Select Market.

Dividends

The payment of any dividends on our common stock is within the discretion of our board of directors. We have never paid cash dividends on our common stock and the board of directors does not expect to declare cash dividends on the common stock in the foreseeable future.

Performance Graph

The graph below compares the performance of our common stock with the performance of the NYSE American Index, the S&P SuperCap Biotechnology index and the Nasdaq Composite Index for the five years ended December 31, 2019. The graph assumes a \$100 investment on December 31, 2014 in our common stock and in each index, with the reinvestment of all dividends, if any.

*\$100 invested on 12/31/14 in stock or index, including reinvestment of dividends. Fiscal year ending December 31.

	12/14	12/15	12/16	12/17	12/18	12/19
Inovio Pharmaceuticals, Inc.	100.00	73.20	75.60	44.99	43.57	35.95
NYSE American	100.00	73.17	87.62	88.68	74.91	85.42
Nasdaq Composite	100.00	106.96	116.45	150.96	146.67	200.49
S&P SuperCap Biotechnology Index	100.00	104.97	88.81	111.77	110.32	123.27

The stock price performance included in this graph is not necessarily indicative of future stock price performance. The performance graph is furnished solely to accompany this Form 10-K annual report and shall not be deemed to be incorporated by reference by means of any general statement incorporating by reference this Form 10-K into any filing under the Securities Act of 1933, as amended, or the Securities Exchange Act of 1934, as amended, except to the extent that we specifically incorporate such information by reference, and shall not otherwise be deemed filed under such acts.

Recent Sales of Unregistered Securities

None.

Purchases of Equity Securities by the Issuer and Affiliated Parties

None.

ITEM 6. SELECTED FINANCIAL DATA

The following selected consolidated financial data should be read together with “Management’s Discussion and Analysis of Financial Condition and Results of Operations” and our consolidated financial statements and related notes included elsewhere in this report. The selected consolidated balance sheet data at December 31, 2019 and 2018 and the selected consolidated statements of operations data for the years ended December 31, 2019, 2018 and 2017 have been derived from our audited consolidated financial statements that are included elsewhere in this report. The selected consolidated balance sheet data at December 31, 2017, 2016, and 2015 and the selected consolidated statements of operations data for the years ended December 31, 2016 and 2015 have been derived from our audited consolidated financial statements not included in this report. Historical results are not necessarily indicative of the results to be expected in the future.

ITEM 7. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS

This report contains forward-looking statements, as defined in Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended. These statements relate to future events or our future financial performance. In some cases, you can identify forward-looking statements by terminology such as "may," "will," "should," "expect," "plan," "anticipate," "believe," "estimate," "predict," "potential" or "continue," the negative of such terms or other comparable terminology. These statements are only predictions. Actual events or results may differ materially.

Although we believe that the expectations reflected in the forward-looking statements are reasonable based on our current expectations and projections, we cannot guarantee future results, levels of activity, performance or achievements. Moreover, neither we, nor any other person, assume responsibility for the accuracy and completeness of the forward-looking statements. We are under no obligation to update any of the forward-looking statements after the filing of this Annual Report to conform such statements to actual results or to changes in our expectations.

The following discussion of our financial condition and results of operations should be read in conjunction with our consolidated financial statements and the related notes and other financial information appearing elsewhere in this Annual Report. Readers are also urged to carefully review and consider the various disclosures made by us which attempt to advise interested parties of the factors which affect our business, including without limitation the disclosures made in Item 1A of Part I of this Annual Report under the Caption "Risk Factors."

Risk factors that could cause actual results to differ from those contained in the forward-looking statements include but are not limited to: our history of losses; our lack of products that have received regulatory approval; uncertainties inherent in clinical trials and product development programs, including but not limited to the fact that pre-clinical and clinical results may not be indicative of results achievable in other trials or for other indications, that the studies or trials may not be successful or achieve desired results, that preclinical studies and clinical trials may not commence, have sufficient enrollment or be completed in the time periods anticipated, that results from one study may not necessarily be reflected or supported by the results of other similar studies, that results from an animal study may not be indicative of results achievable in human studies, that clinical testing is expensive and can take many years to complete, that the outcome of any clinical trial is uncertain and failure can occur at any time during the clinical trial process, and that our electroporation technology and DNA vaccines may fail to show the desired safety and efficacy traits in clinical trials; the availability of funding; the ability to manufacture vaccine candidates; the availability or potential availability of alternative therapies or treatments for the conditions targeted by us or our collaborators, including alternatives that may be more efficacious or cost-effective than any therapy or treatment that we and our collaborators hope to develop; our ability to receive development, regulatory and commercialization event-based payments under our collaborative agreements; whether our proprietary rights are enforceable or defensible or infringe or allegedly infringe on rights of others or can withstand claims of invalidity; and the impact of government healthcare laws and proposals.

Overview

We are a biotechnology company focused on rapidly bringing to market precisely designed DNA medicines to treat, cure, and protect people from diseases associated with human papillomavirus (HPV), cancer, and infectious diseases. Our DNA medicine pipeline is comprised of three types of product candidates, DNA vaccines, DNA immunotherapies and DNA encoded monoclonal antibodies (dMABs). In clinical trials, we have demonstrated that a DNA medicine can be delivered directly into cells in the body via our proprietary smart device to consistently activate robust and fully functional T cell and antibody responses against targeted cancers and pathogens.

Our novel DNA medicine candidates are made using our proprietary SynCon[®] technology that creates optimized plasmids, which are circular strands of DNA that can produce antigens independently inside a cell to help the person's immune system recognize and destroy cancerous or virally infected cells.

Our hand-held CELLECTRA[®] smart delivery devices provide optimized uptake of our DNA medicines within the cell, overcoming a key limitation of other DNA-based technology approaches.

Human data to date have shown a favorable safety profile of our DNA medicines delivered directly into cells in the body using the CELLECTRA[®] smart device in more than 6,000 administrations across more than 2,000 patients.

Our corporate strategy is to advance, protect, and provide our novel DNA medicines to meet urgent and emerging global health needs. We continue to advance and validate an array of DNA medicine candidates that target HPV-related diseases, cancer, and infectious diseases. We aim to advance these candidates through commercialization and continue to leverage third-party resources through collaborations and partnerships, including product license agreements.

Our partners and collaborators include ApolloBio Corp., AstraZeneca, Beijing Advaccine, The Bill & Melinda Gates Foundation, Coalition for Epidemic Preparedness Innovations (CEPI), Defense Advanced Research Projects Agency (DARPA),

GeneOne Life Science, HIV Vaccines Trial Network, the U.S. Defense Threat Reduction Agency's Medical CBRN Defense Consortium (MCDC), National Cancer Institute, National Institutes of Health, National Institute of Allergy and Infectious Diseases, Plumblin Life Sciences, Regeneron Pharmaceuticals, Roche/Genentech, the University of Pennsylvania, the Walter Reed Army Institute of Research, and The Wistar Institute.

We or our collaborators are currently conducting or planning clinical studies of our DNA medicines for HPV-associated precancers, including cervical, vulvar, and anal dysplasia; HPV-associated cancers, including head & neck, cervical, anal, penile, vulvar, and vaginal; other HPV-associated disorders, such as recurrent respiratory papillomatosis, or RRP; glioblastoma multiforme, or GBM; prostate cancer; HIV; Ebola; Middle East Respiratory Syndrome, or MERS; Lassa fever; Zika virus; and the COVID-19 virus (coronavirus).

All of our product candidates are in the research and development phase. We have not generated any revenues from the sale of any products, and we do not expect to generate any such revenues for at least the next several years. We earn revenue from license fees and milestone revenue and collaborative research and development agreements. Our product candidates will require significant additional research and development efforts, including extensive preclinical and clinical testing. All product candidates that we advance to clinical testing will require regulatory approval prior to commercial use, and will require significant costs for commercialization. We may not be successful in our research and development efforts, and we may never generate sufficient product revenue to be profitable.

In July 2019, we announced a strategic organizational restructuring. In order to reduce operating expenses and conserve cash resources, we reduced approximately 28% of our workforce and discontinued our immuno-oncology Phase 1/2 clinical trial of our product candidate INO-5401 in patients with advanced bladder cancer. In the third quarter of 2019, we incurred a personnel-related restructuring charge of \$2.2 million in connection with one-time employee termination costs, including severance and other benefits.

As of December 31, 2019, we had an accumulated deficit of \$739.8 million. We expect to continue to incur substantial operating losses in the future due to our commitment to our research and development programs, the funding of preclinical studies, clinical trials and regulatory activities and the costs of general and administrative activities.

Critical Accounting Policies

The SEC defines critical accounting policies as those that are, in management's view, important to the portrayal of our financial condition and results of operations and require management's judgment. Our discussion and analysis of our financial condition and results of operations are based on our audited consolidated financial statements, which have been prepared in accordance with U.S. GAAP. The preparation of these financial statements requires us to make estimates and judgments that affect the reported amounts of assets, liabilities, revenue and expenses. We base our estimates on experience and on various assumptions that we believe are reasonable under the circumstances, the results of which form the basis for making judgments about the carrying values of assets and liabilities that are not readily apparent from other sources. Actual results may differ from those estimates. Our critical accounting policies include:

Revenue Recognition

Effective January 1, 2018, we adopted Accounting Standards Update ("ASU") 2014-09, *Revenue from Contracts with Customers* ("Topic 606") using the modified retrospective method which consisted of applying and recognizing the cumulative effect of Topic 606 at the date of initial application.

We recognize revenue when we transfer promised goods or services to customers in an amount that reflects the consideration to which we expect to be entitled in exchange for those goods or services. To determine revenue recognition for contracts with customers, we perform the following five steps: (i) identify the contract(s) with a customer; (ii) identify the performance obligations in the contract; (iii) determine the transaction price; (iv) allocate the transaction price to the performance obligations in the contract; and (v) recognize revenue when (or as) we satisfy our performance obligations. At contract inception, we assess the goods or services agreed upon within each contract and assess whether each good or service is distinct and determine those that are performance obligations. We then recognize as revenue the amount of the transaction price that is allocated to the respective performance obligation when (or as) the performance obligation is satisfied.

Collaborative Arrangements

We enter into collaborative arrangements with partners that typically include payment of one or more of the following: (i) license fees; (ii) product supply services; (iii) milestone payments related to the achievement of developmental, regulatory, or commercial goals; and (iv) royalties on net sales of licensed products. Where a portion of non-refundable, upfront fees or other payments received are allocated to continuing performance obligations under the terms of a collaborative arrangement, they are recorded as deferred revenue and recognized as revenue when (or as) the underlying performance obligation is satisfied.

As part of the accounting for these arrangements, we must develop estimates and assumptions that require judgment of management to determine the underlying stand-alone selling price for each performance obligation which determines how the transaction price is allocated among the performance obligation. The stand-alone selling price may include items such as forecasted revenues, development timelines, discount rates and probabilities of technical and regulatory success. We evaluate each performance obligation to determine if it can be satisfied at a point in time or over time. In addition, variable consideration must be evaluated to determine if it is constrained and, therefore, excluded from the transaction price.

License Fees

If a license to intellectual property is determined to be distinct from the other performance obligations identified in the arrangement, we recognize revenues from non-refundable, upfront fees allocated to the license when the license is transferred to the licensee and the licensee is able to use and benefit from the license. For licenses that are bundled with other promises, we utilize judgment to assess the nature of the combined performance obligation to determine whether the combined performance obligation is satisfied over time or at a point in time and, if over time, the appropriate method of measuring progress for purposes of recognizing revenue. We evaluate the measure of progress each reporting period and, if necessary, adjust the measure of performance and related revenue recognition.

Product Supply Services

Arrangements that include a promise for future supply of drug product for either clinical development or commercial supply at the licensee's discretion are generally considered as options. We assess if these options provide a material right to the licensee and if so, they are accounted for as separate performance obligations. We evaluate whether we are the principal or agent in the arrangement. We have determined that we are the principal in current arrangements as we control the product supply before it is transferred to the customer.

Milestone Payments

At the inception of each arrangement that includes milestone payments (variable consideration), we evaluate whether the milestones are considered probable of being reached and estimate the amount to be included in the transaction price using the most likely amount method. If it is probable that a significant revenue reversal would not occur, the associated milestone value is included in the transaction price. Milestone payments that are not within our or our collaboration partner's control, such as regulatory approvals, are generally not considered probable of being achieved until those approvals are received. The transaction price is then allocated to each performance obligation on a relative stand-alone selling price basis, for which we recognize revenue as or when the performance obligations under the contract are satisfied. At the end of each subsequent reporting period, we re-evaluate the probability of achieving such milestones and any related constraint, and if necessary, adjust our estimate of the overall transaction price. Any such adjustments are recorded on a cumulative catch-up basis, which would affect license, collaboration or other revenues and earnings in the period of adjustment.

Royalties

For arrangements that include sales-based royalties, including milestone payments based on the level of sales, and for which the license is deemed to be the predominant item to which the royalties relate, we recognize revenue at the later of (i) when the related sales occur, or (ii) when the performance obligation to which some or all of the royalty has been allocated has been satisfied (or partially satisfied). To date, we have not recognized any royalty revenue resulting from any of our collaborative arrangements.

Grants

We have determined that as of January 1, 2018, accounting for our various grant agreements falls under the contributions guidance under Subtopic 958-605, *Not-for-Profit Entities-Revenue Recognition*, which is outside the scope of Topic 606, as the government agencies granting us funds are not receiving reciprocal value for their contributions. Beginning on January 1, 2018, all contributions received from current grant agreements are recorded as a contra-expense as opposed to revenue on the consolidated statement of operations.

Leases

We adopted ASU 2016-02, *Leases (Topic 842)*, or "Topic 842", on January 1, 2019. For our long-term operating leases, we recognized an operating lease right-of-use asset and an operating lease liability on our consolidated balance sheets. The lease liability is determined as the present value of future lease payments using an estimated rate of interest that we would pay to borrow equivalent funds on a collateralized basis at the lease commencement date. The right-of-use asset is based on the liability adjusted for any prepaid or deferred rent. We determined the lease term at the commencement date by considering whether renewal options and termination options are reasonably assured of exercise.

Fixed rent expense for our operating leases is recognized on a straight-line basis over the term of the lease and is included in operating expenses on the consolidated statements of operations. Variable lease payments including lease operating expenses are recorded as incurred.

Prior period amounts continue to be reported in accordance with the historic accounting under the previous lease guidance.

Derivative Liabilities

We evaluate our debt and equity issuances to determine if those contracts or embedded components of those contracts qualify as derivatives requiring separate recognition in our financial statements. The result of this accounting treatment is that the fair value of the embedded derivative is revalued at each balance sheet date and recorded as a liability, and the change in fair value during the reporting period is recorded in other income (expense) in the consolidated statements of operations. In circumstances where the embedded conversion option in a convertible instrument is required to be bifurcated and there are also other embedded derivative instruments in the convertible instrument that are required to be bifurcated, the bifurcated derivative instruments are accounted for as a single, compound derivative instrument. The classification of derivative instruments, including whether such instruments should be recorded as liabilities or as equity, is reassessed at the end of each reporting period. Derivative instrument liabilities are classified in the balance sheet as current or non-current based on whether or not net-cash settlement of the derivative instrument is expected within twelve months of the balance sheet date.

Research and Development Expenses

Our activities have largely consisted of research and development efforts related to developing electroporation delivery technologies and DNA immunotherapies and vaccines. Research and development expenses consist of expenses incurred in performing research and development activities including salaries and benefits, facilities and other overhead expenses, clinical trials, contract services and other outside expenses. Research and development expenses are charged to operations as they are incurred. These expenses result from our independent research and development efforts as well as efforts associated with collaborations and licensing arrangements. We review and accrue clinical trial expense based on work performed, relying on estimates of total costs incurred based on patient enrollment, completion of studies and other events. We follow this method since reasonably dependable estimates of the costs applicable to various stages of a research agreement or clinical trial can be made. Accrued clinical trial costs are subject to revisions as trials progress. Revisions are charged to expense in the period in which the facts that give rise to the revision become known. Historically, revisions have not resulted in material changes to research and development expense; however a modification in the protocol of a clinical trial or cancellation of a trial could result in a charge to our results of operations.

Recent Accounting Pronouncements

Information regarding recent accounting pronouncements is contained in Note 2 to the consolidated financial statements, included elsewhere in this report.

Results of Operations

The consolidated financial data for the years ended December 31, 2019, 2018 and 2017 is presented in the following table and the results of these periods are used in the discussion thereafter.

	Year Ended December 31,			Increase/(Decrease) 2019 vs. 2018		Increase/(Decrease) 2018 vs. 2017

(1) Beginning on January 1, 2018, all contributions received from current grant agreements are recorded as a contra-expense as opposed to revenue on the consolidated statement of operations

Comparison of Years Ended December 31, 2019 and 2018

Revenue

Revenue primarily consisted of revenues under collaborative research and development arrangements, including arrangements with affiliated entities for the years ended December 31, 2019 and 2018. Our year over year total revenue decreased \$26.4 million, or 87%. The decrease was primarily due to the recognition of a one-time upfront payment of \$23.0 million from ApolloBio during the second quarter of 2018.

Research and Development Expenses

The \$7.2 million decrease in research and development expenses for the year ended December 31, 2019 as compared to 2018 was primarily due to a decrease in expenses related to our collaboration with AstraZeneca of \$2.9 million, a decrease in employee compensation expense of \$2.6 million due to lower employee headcount and an increase in contra-research and development expense recorded from grant agreements of \$2.4 million, as well as no sub-license fee expense in 2019 as compared to \$1.9 million recorded in 2018 related to the ApolloBio collaboration. These decreases were offset by an increase in clinical trial related expenses of \$3.5 million and the one-time personnel-related restructuring charge of approximately \$1.9 million in connection with the employee termination costs incurred during the third quarter of 2019, among other variances.

Contributions received from current grant agreements and recorded as contra-research and development expense were \$11.9 million and \$9.5 million for the years ended December 31, 2019 and 2018, respectively. The increase year over year was primarily due to an increase of \$1.9 million earned from the CEPI grant, an increase of \$1.9 million from the Bill & Melinda Gates Foundation grant and an increase of \$890,000 from the MCDC grant, offset in part by decreases of \$1.1 million and \$963,000 from various Wistar sub-grants and the DARPA Ebola grant, respectively, among other variances.

General and Administrative Expenses

The \$2.1 million decrease in general and administrative expenses for the year ended December 31, 2019 as compared to 2018 was primarily related to the \$1.4 million of foreign non-income taxes withheld from the ApolloBio upfront payment we received in 2018 and the associated advisory fees of \$960,000, among other variances.

Stock-based Compensation

Employee stock-based compensation cost is measured at the grant date, based on the fair value of the award, and is recognized as expense over the employee's requisite service period. Total employee stock-based compensation cost for the years ended December 31, 2019 and 2018 was \$9.8 million and \$10.2 million, of which \$5.9 million and \$5.9 million was included in research and development expenses and \$3.9 million and \$4.3 million was included in general and administrative expenses, respectively. The slight decrease for 2019 compared to 2018 was primarily due to the reversal of previously recognized stock-based compensation expense due to the reduction in our workforce in July 2019 and a lower weighted average grant date fair value for the awards granted in 2019, offset by an option modification expense recorded in the second quarter of 2019. At December 31, 2019, there was \$3.4 million of total unrecognized compensation cost related to unvested stock options, which we expect to recognize over a weighted-average period of 1.7 years, as compared to \$5.2 million for the year ended December 31, 2018 expected to be recognized over a weighted-average period of 1.7 years. At December 31, 2019, there was \$4.3 million of total unrecognized compensation cost related to unvested restricted stock units, which is expected to be recognized over a weighted-average period of 1.6 years, as compared to \$5.1 million for the year ended December 31, 2018 expected to be recognized over a weighted-average period of 1.7 years. Total stock-based compensation for options granted to non-employees for the years ended December 31, 2019 and 2018 was \$970,000 and \$302,000, respectively.

Interest Income

The \$341,000 increase in interest income for the year ended December 31, 2019 as compared to 2018 was primarily related to the interest earned on our higher short-term investments holdings in 2019.

Interest Expense

The interest expense for the year ended December 31, 2019 of \$7.9 million primarily relates to our 6.5% convertible senior notes due 2024, or the Notes, which were issued during the first quarter of 2019, as well as our 1.0% convertible bonds due August 2024, or the August 2019 Bonds, which were issued during the third quarter of 2019.

Change in Fair Value of Common Stock Warrants

The change in fair value of common stock warrants for the year ended December 31, 2018 was \$361,000. The warrants were exercised during the quarter ended September 30, 2018, eliminating the associated fair value re-measurement in subsequent periods.

Change in Fair Value of Derivative Liability

The change in fair value of derivative liability for the year ended December 31, 2019 was \$1.8 million. We determined that our August 2019 Bonds included an embedded conversion feature that is considered to be a derivative liability requiring bifurcation from the debt instrument and separate recognition in our financial statements. The conversion option is revalued at each reporting period with the resulting changes in fair value reflected in the consolidated statements of operations.

Loss on Investment in Affiliated Entity

The loss on investment in affiliated entity for the years ended December 31, 2019 and 2018 was \$3.1 million and \$2.0 million, respectively, resulting from the change in the fair market value of our investments in GeneOne and PLS. We record our investments in GeneOne and PLS at their market values based on the closing prices of those securities on the applicable stock exchange at each balance sheet date, with changes in fair value reflected in the consolidated statements of operations.

Income Tax Benefit/Provision for Income Taxes

The income tax benefit of \$257,000 for the year ended December 31, 2019 reflected our application of the intraperiod tax allocation rules under which we are required to record a tax benefit in continuing operations to offset the tax provision we recorded directly to other comprehensive income (loss) related to unrealized gains on our short-term investments. The provision for income taxes of \$2.2 million for the year ended December 31, 2018 was related to foreign income taxes on the upfront payment received from ApolloBio in 2018.

Income Taxes

Since inception, we have incurred operating losses and accordingly have not recorded a provision for U.S. income taxes for any of the periods presented. Utilization of net operating losses and tax credits are subject to a substantial annual limitation due to ownership change limitations provided by the Internal Revenue Code of 1986, as amended, or IRC. As of December 31, 2019, we had net operating loss carry forwards for U.S. federal, California and Pennsylvania income tax purposes of \$483.3 million, \$68.6 million and \$80.5 million, respectively, net of the net operating losses that will expire due to IRC Section 382 limitations. We also had U.S. federal and state research and development tax credits of \$17.3 million and \$3.2 million, respectively, net of the federal research and development credits that will expire due to IRC Section 383 limitations. The net operating losses and credits began to expire during 2020.

Comparison of Years Ended December 31, 2018 and 2017

Revenue

Revenue primarily consisted of revenue under collaborative research and development arrangements for the year ended December 31, 2018, and revenue under collaborative research and development arrangements, grants and government contracts for the year ended December 31, 2017. Our year over year total revenue decreased \$11.7 million, or 28%.

As of January 1, 2018, accounting for our various grant agreements falls under the contributions guidance under Subtopic 958-605, *Not-for-Profit Entities-Revenue Recognition*, which is outside the scope of Topic 606, as the government agencies granting us funds are not receiving equivalent value for their contributions. Beginning on January 1, 2018, after adopting Topic 606 using the modified retrospective transition method, all contributions received from current grant agreements are being recorded as a contra-expense as opposed to revenue on the consolidated statement of operations.

The \$1.1 million increase in revenue under collaborative research and development arrangements for the year ended December 31, 2018 as compared to 2017 was primarily due to the recognition of the gross upfront payment of \$23.0 million from ApolloBio during the second quarter of 2018. This increase was offset by an overall decrease in revenue from the AstraZeneca collaboration of \$15.4 million, primarily related to previously deferred revenue recognized during the second quarter of 2017, upon selection of the first cancer research collaboration product candidate by AstraZeneca, among other variances. There was also no revenue recognized in 2018 from Roche compared to \$6.1 million for 2017, due to the termination of the agreement in 2017.

For the year ended December 31, 2018, grant funding received and recorded as contra-research and development expense was \$9.5 million, as compared to \$13.0 million recorded as grant and miscellaneous revenue, including arrangements with affiliated entities, for the year ended December 31, 2017. The decrease in grant funding recorded for the year over year was primarily due to a decrease from our DARPA Ebola grant of \$8.8 million, partially offset by an increase from our CEPI grant of \$4.3 million.

Research and Development Expenses

The \$3.3 million decrease in research and development expenses for the year ended December 31, 2018 as compared to 2017 was primarily due to the \$9.5 million contra-research and development expense recorded from grant agreements as discussed above, as well as a decrease of \$8.9 million in expenses related to the DARPA Ebola grant and a decrease of \$2.0 million in expenses related to our Hepatitis B program. These decreases were partially offset by an increase of \$4.0 million related to increased employee headcount to support clinical trials and partnerships, an increase of \$3.1 million for drug manufacturing related to our collaboration with AstraZeneca, an increase in expenses related to our GBM clinical trial of \$2.8 million, an increase in expenses of \$2.6 million related to our VGX-3100 Phase 3 clinical trial, an increase in expenses of \$2.6 million related to our CEPI grant and an increase in depreciation expense of \$2.3 million, among other variances.

General and Administrative Expenses

The \$1.0 million increase in general and administrative expenses for the year ended December 31, 2018 as compared to 2017 was primarily related to the \$1.4 million of foreign non-income taxes withheld from the ApolloBio upfront payment we received in 2018 and the advisory fee of \$960,000 incurred in connection with receiving the upfront payment. There were also increases in legal expense and personnel costs from increases in employee headcount of \$1.3 million and \$1.2 million, respectively, partially offset by a decrease in non-cash stock-based compensation expense of \$2.8 million and depreciation expense of \$1.4 million, among other variances.

Stock-based Compensation

Employee stock-based compensation cost is measured at the grant date, based on the fair value of the award, and is recognized as expense over the employee's requisite service period. Total employee stock-based compensation cost for the years ended December 31, 2018 and 2017 was \$10.2 million and \$12.9 million, of which \$5.9 million and \$5.8 million was included in research and development expenses and \$4.3 million and \$7.1 million was included in general and administrative expenses, respectively. The year over year decrease was primarily due to a lower weighted average grant date fair value for the

awards granted in 2018, as well as higher expenses recorded for certain stock option modifications which occurred in 2017. At December 31, 2018, there was \$5.2 million of total unrecognized compensation cost related to unvested stock options, which we expect to recognize over a weighted-average period of 1.7 years, as compared to \$5.9 million for the year ended December 31, 2017 expected to be recognized over a weighted-average period of 1.8 years. At December 31, 2018, there was \$5.1 million of total unrecognized compensation cost related to unvested restricted stock units, which is expected to be recognized over a weighted-average period of 1.7 years, as compared to \$5.3 million for the year ended December 31, 2017 expected to be recognized over a weighted-average period of 1.8 years. Total stock-based compensation for options granted to non-employees for the years ended December 31, 2018 and 2017 was \$302,000 and \$201,000, respectively.

Gain on Sale of Assets

The gain on sale of assets for the year ended December 31, 2017 related to the sale of our compound VGX-1027 to GeneOne for a purchase price of \$1.0 million. These assets had a carrying value of zero, resulting in the full proceeds being recognized as a gain on sale.

Interest and Other Income, net

Interest and other income, net, decreased by \$692,000 for the year ended December 31, 2018 as compared to 2017 primarily due to an increase in net realized loss recorded on short-term investments, partially offset by higher interest earned on short-term investments during the year.

Change in Fair Value of Common Stock Warrants

The change in fair value of common stock warrants for the years ended December 31, 2018 and 2017 was \$361,000 and \$807,000, respectively. The variance is due to the revaluation of the warrants to their fair value at each balance sheet date; in addition, the warrants were exercised during the quarter ended September 30, 2018, eliminating the associated warrant liability.

Loss on Investment in Affiliated Entity

The loss on investment in affiliated entity for the years ended December 31, 2018 and 2017 was \$2.0 million and \$7.0 million, respectively, resulting from the change in the fair market value of the investments in GeneOne and PLS. After the adoption of ASU No. 2016-01 on January 1, 2018, unrealized gains and losses on PLS are recorded on the consolidated statement of operations as a gain (loss) on investment in affiliated entity rather than the consolidated statement of comprehensive income (loss).

Provision for Income Taxes

The provision for income taxes of \$2.2 million for the year ended December 31, 2018 was related to foreign income taxes on the upfront payment received from ApolloBio in 2018. There was no income tax provision or benefit recorded for the year ended December 31, 2017.

Liquidity and Capital Resources

Historically, our primary uses of cash have been to finance research and development activities including clinical trial activities in the oncology, DNA vaccines and other immunotherapy areas of our business. Since inception, we have satisfied our cash requirements principally from proceeds from the sale of equity securities, indebtedness and grants and government contracts.

Working Capital and Liquidity

As of December 31, 2019, we had cash and short-term investments of \$89.5 million and working capital of \$62.2 million, as compared to \$81.2 million and \$52.5 million as of December 31, 2018, respectively. The increase in cash and short-term investments during the year ended December 31, 2019 was primarily due to the net proceeds of \$75.7 million received from the issuance of the Notes and net proceeds of \$14.5 million and \$4.0 million received from the issuance of the August 2019 Bonds and December 2019 Bonds, respectively, offset by expenditures related to our research and development activities, clinical trials and various general and administrative expenses related to legal, consultants, accounting and audit, and corporate development.

Net cash used in operating activities for the year ended December 31, 2019 of \$97.9 million consisted of net loss of \$120.6 million less use of net cash in operating assets and liabilities of \$3.5 million, partially offset by net non-cash adjustments of \$26.2 million. The primary non-cash expenses added back to net loss included stock-based compensation of \$10.9 million, interest expense of \$5.2 million, depreciation and amortization of \$4.7 million, loss on investment in affiliated entities of \$3.1 million and change in fair value of derivative liability of \$1.8 million.

Net cash used in operating activities for the year ended December 31, 2018 of \$73.6 million consisted of net loss of \$97.0 million less use of net cash in operating assets and liabilities of \$4.7 million, partially offset by net non-cash adjustments of \$18.7 million. The primary non-cash expenses added back to net loss included stock-based compensation of \$10.7 million, depreciation and amortization of \$5.0 million and loss on investment in affiliated entities and short-term investments of \$2.0 million and \$1.3 million, respectively.

Net cash (used in) provided by investing activities was \$(9.0) million and \$42.4 million for the years ended December 31, 2019 and 2018, respectively. The variance was primarily the result of timing differences in short-term investment purchases, sales and maturities.

Net cash provided by financing activities was \$105.4 million and \$31.0 million for the years ended December 31, 2019 and 2018, respectively. The variance was primarily due to the net proceeds received from our issuance of the Notes, August 2019 Bonds and December 2019 Bonds (described below), as well as the \$3.0 million acquisition of a non-controlling interest in Geneos, all of which occurred in 2019.

Issuances of Notes and Bonds

In the fourth quarter of 2019, we completed a private placement of our 1.0% convertible bonds due December 2024, or the December 2019 Bonds, to an institutional investor in Korea for an aggregate principal amount of 4.7 billion Korean Won (KRW) (approximately USD \$4.1 million based on the exchange rate on the date of issuance). Net proceeds from the offering were \$4.0 million, after deducting the offering expenses payable by us. See Note 10 to the consolidated financial statements included in this report for further discussion.

In the third quarter of 2019, we completed a private placement of aggregate principal amount of 18 billion Korean Won (KRW) (approximately USD \$15.0 million based on the exchange rate on the date of issuance) of August 2019 Bonds issued to institutional investors led by Korea Investment Partners. Net proceeds from the offering were \$14.5 million, after deducting the offering expenses payable by us. See Note 10 to the consolidated financial statements included in this report for further discussion.

In the first quarter of 2019, we completed a private placement of \$78.5 million aggregate principal amount of Notes, sold to qualified institutional buyers pursuant to Rule 144A under the Securities Act of 1933, as amended. Net proceeds from the offering were \$75.7 million, after deducting the initial purchasers' discount and offering expenses payable by us. See Note 10 to the consolidated financial statements included in this report for further discussion.

Issuances of Common Stock

In May 2018, we entered into an At-the-Market Equity Offering Sales Agreement (the "Sales Agreement"), with an outside placement agent (the "Placement Agent"), to sell shares of our common stock with aggregate gross proceeds of up to \$100.0 million, from time to time, through an "at-the-market" equity offering program under which the Placement Agent will act as sales agent. During the years ended December 31, 2019 and 2018, we sold 3,340,678 and 5,354,075 shares of common stock under the Sales Agreement for aggregate net proceeds of \$9.1 million and \$27.7 million, respectively. During the years ended December 31, 2018 and 2017, we had a prior sales agreement with the same Placement Agent pursuant to which we sold 314,950 and 2,937,406 shares of common stock for aggregate net proceeds of \$1.6 million and \$24.2 million, respectively.

On February 7, 2020 and March 9, 2020, we entered into a first and second amendment to the Sales Agreement, respectively, which amendments increased the amount of our common stock that could be sold through the Placement Agent under the Sales Agreement from an aggregate offering price of up to \$100.0 million to an aggregate offering price of up to \$250.0 million. During the period from January 1, 2020 to March 11, 2020 we sold an additional 43,148,952 shares of common stock under the Sales Agreement for aggregate net proceeds of \$208,200,000.0 million. Following these sales, as of March 11, 2020, there is no remaining capacity under the Sales Agreement.

In July 2017, we closed an underwritten public offering of 12,500,000 shares of our common stock at a public offering price of \$6.00 per share. The net proceeds, after deducting the underwriters' discounts and commissions and other offering expenses, were \$70.1 million.

During the year ended December 31, 2019, stock options to purchase 42,969 shares of common stock were exercised for aggregate net proceeds of \$113,000, offset by tax payments made related to net share settlement of RSU awards of \$893,000. During the year ended December 31, 2018, stock options and warrants to purchase 756,853 shares of common stock were exercised for aggregate net proceeds of \$2.4 million, offset by tax payments made related to net share settlement of RSU awards of \$612,000. During the year ended December 31, 2017, stock options to purchase 452,973 shares of common stock were exercised for aggregate net proceeds of \$2.3 million.

Cost Reductions

In July 2019, we announced a strategic organizational restructuring. In order to reduce operating expenses and conserve cash resources, we also reduced approximately 28% of our workforce and discontinued our immuno-oncology Phase 1/2 clinical

trial of our product candidate INO-5401 in patients with advanced bladder cancer. During 2019, we incurred a personnel-related restructuring charge of \$2.2 million in connection with one-time employee termination costs, including severance and other benefits.

As of December 31, 2019, we had an accumulated deficit of \$739.8 million and we expect to continue to operate at a loss for some time. The amount of the accumulated deficit will continue to increase, as it will be expensive to continue research and development efforts. These activities will require additional financing. If these activities are successful and if we receive approval from the FDA to market our DNA vaccine and DNA immunotherapy product candidates, then we will need to raise additional funding to market and sell the approved products and equipment. We cannot predict the outcome of the above matters at this time. We are evaluating potential collaborations as an additional way to fund operations. We believe that our current cash and short-term investments are sufficient to meet our planned working capital requirements for at least the next twelve months.

Off-Balance Sheet Arrangements

We did not have during the periods presented, and we do not currently have, any off-balance sheet arrangements, as defined in the rules and regulations of the SEC.

Contractual Obligations

As of December 31, 2019, future minimum payments due under our contractual obligations are as follows:

	Payments Due by Period				
	Total	Less than 1 year	1 – 3 years	3 – 5 years	More than 5 years
Convertible senior notes (1)	\$ 101,463,000	\$ 5,103,000	\$ 10,206,000	\$ 86,154,000	\$ —
Convertible bonds (2)	\$ 26,035,000	\$ 187,000	\$ 394,000	\$ 25,454,000	\$ —
Operating lease obligations (3)	\$ 31,897,000	\$ 3,891,000	\$ 8,031,000	\$ 7,024,000	\$ 12,951,000

(1) Amounts represent contractual amounts due under our Notes, including interest based on the fixed rate of 6.5% per year. Although these Notes mature in March 2024, they may be converted into shares of our common stock prior to maturity if certain conditions are met. Any conversion prior to maturity can result in repayments of the principal amounts sooner than the scheduled repayments as indicated in the table. See Note 10, "Convertible Debt" in the Consolidated Financial Statements section of this report for further discussion.

(2) Amounts represent contractual amounts due under our August 2019 and December 2019 Bonds, including interest based on the fixed rate of 1% per year plus a premium on such bonds to provide an internal rate of return with respect to such Bonds of 6% at maturity. Although these bonds mature in August 2024 and December 2024, respectively, they may be converted into KDRs, if we have any such securities listed on the KOSDAQ at that time, or otherwise shares of common stock, if KDRs are not listed on KOSDAQ at that time or the converting holder requests delivery of shares of common stock, prior to maturity if certain conditions are met. Any conversion prior to maturity can result in repayments of the principal amounts sooner than the scheduled repayments as indicated in the table. See Note 10, "Convertible Debt" in the Consolidated Financial Statements section of this report for further discussion.

(3) We have entered into operating leases for our facilities, which expire from 2023 to 2029, and operating leases for office equipment, which expire in 2021 and 2022. In the fourth quarter of 2019, we entered into two subleases for a portion of our Plymouth Meeting corporate headquarters facility through December 31, 2022 and March 31, 2025. As of December 31, 2019, we expect to receive aggregate future minimum lease payments totaling \$1.5 million (non-discounted) over the duration of the sublease agreements, which expected payments are not included in the table above.

In the normal course of business, we are a party to a variety of agreements pursuant to which we may be obligated to indemnify the other party. It is not possible to predict the maximum potential amount of future payments under these types of agreements due to the conditional nature of our obligations and the unique facts and circumstances involved in each particular agreement. Historically, payments made by us under these types of agreements have not had a material effect on our business, consolidated results of operations or financial condition.

ITEM 7A. QUALITATIVE AND QUANTITATIVE DISCLOSURES ABOUT MARKET RISK

Interest Rate Risk

Market risk represents the risk of loss that may impact our consolidated financial position, results of operations or cash flows due to adverse changes in financial and commodity market prices and rates. We are exposed to market risk primarily in

the area of changes in United States interest rates and conditions in the credit markets, and the recent fluctuations in interest rates and availability of funding in the credit markets primarily impact the performance of our investments. We do not have any material foreign currency or other derivative financial instruments. Under our current policies, we do not use interest rate derivative instruments to manage exposure to interest rate changes. We attempt to increase the safety and preservation of our invested principal funds by limiting default risk, market risk and reinvestment risk. We mitigate default risk by investing in investment grade securities. Due to the short-term maturities of our cash equivalents and the low risk profile of our investments at December 31, 2019, an immediate 100 basis point change in interest rates would not have a material effect on the fair market value of our cash equivalents.

The interest rate on our indebtedness, consisting exclusively of the Notes and Bonds, is fixed and not subject to fluctuations in interest rates.

Fair Value Measurements

The investment in affiliated entities represents our ownership interest in the Korean-based companies, GeneOne and PLS. We report these investments at fair value on the consolidated balance sheet using the closing price of GeneOne and PLS shares of common stock as reported on the date of determination on the Korean Stock Exchange and Korea New Exchange Market, respectively.

Foreign Currency Risk

We have operated primarily in the United States and most transactions during the year ended December 31, 2019 were made in United States dollars. Accordingly, we have not had any material exposure to foreign currency rate fluctuations, with the exception of the issuance of the August 2019 and December 2019 Bonds, which are denominated in South Korean Won, and the valuation of our equity investments in GeneOne and PLS, each of which is denominated in South Korean Won and then translated into United States dollars. We do not have any foreign currency hedging instruments in place.

Certain transactions are denominated primarily in foreign currencies, including South Korean Won, Euros, British Pounds and Canadian Dollars. These transactions give rise to monetary assets and liabilities that are denominated in currencies other than the U.S. dollar. The value of these monetary assets and liabilities are subject to changes in currency exchange rates from the time the transactions are originated until settlement in cash. As a result, our financial results could be affected by factors such as changes in foreign currency exchange rates or weak economic conditions in foreign markets where we conduct business.

We do not use derivative financial instruments for speculative purposes and do not engage in exchange rate hedging or hold or issue foreign exchange contracts for trading purposes.

ITEM 8. FINANCIAL STATEMENTS AND SUPPLEMENTARY DATA

The information required by this Item 8 is incorporated by reference to our Consolidated Financial Statements and the Report of Independent Registered Public Accounting Firm beginning at page F-1 of this report.

ITEM 9. CHANGES IN AND DISAGREEMENTS WITH ACCOUNTANTS ON ACCOUNTING AND FINANCIAL DISCLOSURE

None.

ITEM 9A. CONTROLS AND PROCEDURES

Evaluation of Disclosure Controls and Procedures

We maintain disclosure controls and procedures, which are designed to ensure that information required to be disclosed in the reports we file or submit under the Securities Exchange Act of 1934, as amended, is recorded, processed, summarized and reported within the time periods specified in the SEC's rules and forms, and that such information is accumulated and communicated to our management, including our Chief Executive Officer, or CEO, and Chief Financial Officer, or CFO, as appropriate to allow timely decisions regarding required disclosures.

In designing and evaluating our disclosure controls and procedures, management recognizes that disclosure controls and procedures, no matter how well conceived and operated, can provide only reasonable, not absolute, assurance that the objectives of the disclosure controls and procedures are met. Additionally, in designing disclosure controls and procedures, our management necessarily was required to apply its judgment in evaluating the cost-benefit relationship of possible disclosure controls and procedures. The design of any system of controls also is based in part upon certain assumptions about the likelihood of future events, and there can be no assurance that any design will succeed in achieving its stated goals under all potential future conditions; over time, controls may become inadequate because of changes in conditions, or the degree of

compliance with policies or procedures may deteriorate. Because of the inherent limitations in a control system, misstatements due to error or fraud may occur and not be detected.

Based on an evaluation carried out as of the end of the period covered by this Annual Report, under the supervision and with the participation of our management, including our CEO and CFO, our CEO and CFO have concluded that, as of the end of such period, our disclosure controls and procedures (as defined in Rule 13a-15(e) and 15d-15(e) under the Securities Exchange Act of 1934) were effective as of December 31, 2019 at the reasonable assurance level.

Internal Control Over Financial Reporting

Management's Report on Internal Control Over Financial Reporting

Our management is responsible for establishing and maintaining adequate internal control over financial reporting, as defined in Rules 13a-15(f) and 15d-15(f) under the Securities Exchange Act of 1934. Our internal control over financial reporting is a process designed under the supervision of our Chief Executive Officer and Chief Financial Officer to provide reasonable assurance regarding the reliability of financial reporting and the preparation of our financial statements for external purposes in accordance with United States generally accepted accounting principles.

As of December 31, 2019, management, with the participation of the Chief Executive Officer and Chief Financial Officer, assessed the effectiveness of our internal control over financial reporting based on the criteria for effective internal control over financial reporting established in "Internal Control—Integrated Framework," issued by the Committee of Sponsoring Organizations of the Treadway Commission (2013 framework). Based on the assessment, management determined that we maintained effective internal control over financial reporting as of December 31, 2019.

Changes in Internal Control over Financial Reporting

There have not been any changes in our internal control over financial reporting that occurred during the fourth quarter of our fiscal year ended December 31, 2019, that materially affected, or are reasonably likely to materially affect, our internal control over financial reporting.

Attestation Report of Independent Registered Public Accounting Firm

The independent registered public accounting firm that audited the consolidated financial statements that are included in this Annual Report on Form 10-K has issued an audit report on the effectiveness of our internal control over financial reporting as of December 31, 2019. The report appears below.

REPORT OF INDEPENDENT REGISTERED PUBLIC ACCOUNTING FIRM

The Board of Directors and Stockholders of Inovio Pharmaceuticals, Inc.

Opinion on Internal Control over Financial Reporting

We have audited Inovio Pharmaceuticals, Inc.'s internal control over financial reporting as of December 31, 2019, based on criteria established in *Internal Control-Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission 2013 framework (the COSO criteria). In our opinion, Inovio Pharmaceuticals, Inc. (the Company) maintained, in all material respects, effective internal control over financial reporting as of December 31, 2019, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States) (PCAOB), the consolidated balance sheets of the Company as of December 31, 2019 and 2018, the related consolidated statements of operations, comprehensive loss, stockholders' equity, and cash flows, for each of the three years in the period ended December 31, 2019 and related notes and our report dated March 12, 2020 expressed an unqualified opinion thereon.

Basis for Opinion

The Company's management is responsible for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Management's Report on Internal Control over Financial Reporting. Our responsibility is to express an opinion on the Company's internal control over financial reporting based on our audit. We are a public accounting firm registered with the PCAOB and are required to be independent with respect to the Company in accordance with the U.S. federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audit in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects.

Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

Definition and Limitations of Internal Control Over Financial Reporting

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

REPORT OF INDEPENDENT REGISTERED PUBLIC ACCOUNTING FIRM

The Board of Directors and Stockholders of Inovio Pharmaceuticals, Inc.

Opinion on the Financial Statements

We have audited the accompanying consolidated balance sheets of Inovio Pharmaceuticals, Inc. (the "Company") as of December 31, 2019 and 2018, the related consolidated statements of operations, comprehensive loss, stockholders' equity, and cash flows, for each of the three years in the period ended December 31, 2019, and the related notes (collectively referred to as the "consolidated financial statements"). In our opinion, the consolidated financial statements present fairly, in all material respects, the financial position of the Company as of December 31, 2019 and 2018, and the results of its operations and its cash flows for each of the three years in the period ended December 31, 2019, in conformity with US generally accepted accounting principles.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States) (PCAOB), the Company's internal control over financial reporting as of December 31, 2019, based on criteria established in *Internal Control-Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission (2013 Framework) and our report dated March 12, 2020 expressed an unqualified opinion thereon.

Adoption of ASU No. 2014-09

As discussed in Note 2 to the consolidated financial statements, the Company changed its method for recognizing revenue as a result of the adoption of Accounting Standards Update (ASU) No. 2014-09, Revenue from Contracts with Customers (Topic 606), using the modified retrospective method effective January 1, 2018.

Adoption of ASU No. 2016-02

As discussed in Note 2 to the consolidated financial statements, the Company recognized an operating lease right-of-use asset and an operating lease liability as a result of the adoption of Accounting Standards Update (ASU) No. 2016-02, Leases (Topic 842), using the modified retrospective method effective January 1, 2019.

Basis for Opinion

These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on the Company's financial statements based on our audits. We are a public accounting firm registered with the PCAOB and are required to be independent with respect to the Company in accordance with the US federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audits in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement, whether due to error or fraud. Our audits included performing procedures to assess the risks of material misstatement of the financial statements, whether due to error or fraud, and performing procedures that respond to those risks. Such procedures include examining, on a test basis, evidence regarding the amounts and disclosures in the financial statements. Our audits also included evaluating the accounting principles used and significant estimates made by management, as well as evaluating the overall presentation of the financial statements. We believe that our audits provide a reasonable basis for our opinion.

/s/ Ernst & Young LLP

We have served as the Company's auditor since 2002.

(1) Upon adoption of ASU 2016-09 on January 1, 2017, the Company elected to remove the forfeiture rate from the calculation of stock-based compensation and recorded a cumulative catch-up adjustment to accumulated deficit with a corresponding offset to additional paid-in-capital of \$312,000.

(2) Upon adoption of ASU 2016-01 on January 1, 2018, the Company began to measure and record equity investments, except those accounted for under the equity method of accounting that have a readily determinable fair value, at fair value and began to recognize the changes in fair value in its consolidated statements of operations, instead of recognizing unrealized gains and losses through accumulated other comprehensive income (loss), as done under the previous guidance. The Company recorded a \$231,000 cumulative effect adjustment to reclassify the cumulative unrealized gain, net of tax effect, from its investment in PLS from accumulated other comprehensive loss to accumulated deficit.

The accompanying notes are an integral part of these consolidated financial statements.

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS

1. The Company

Inovio Pharmaceuticals, Inc. (the "Company" or "Inovio"), is a biotechnology company focused on rapidly bringing to market precisely designed DNA medicines to treat, cure, and protect people from diseases associated with human papillomavirus (HPV), cancer, and infectious diseases. The Company's DNA medicine pipeline is comprised of three types of candidates, DNA vaccines, DNA immunotherapies and DNA encoded monoclonal antibodies (dMABs). In clinical trials, Inovio has demonstrated that a DNA medicine can be delivered directly into cells in the body via its proprietary smart device to consistently activate robust and fully functional T cell and antibody responses against targeted cancers and pathogens.

The Company's novel DNA medicines are made using its proprietary SynCon[®] technology that creates optimized plasmids, which are circular strands of DNA that can produce antigens independently inside a cell to help the person's immune system recognize and destroy cancerous or virally infected cells.

Inovio's hand-held CELLECTRA[®] smart delivery devices provide optimized uptake of its DNA medicines within the cell, overcoming a key limitation of other DNA-based technology approaches.

Human data to date have shown a favorable safety profile of Inovio's DNA medicines delivered directly into cells in the body using the CELLECTRA[®] smart delivery device in more than 6,000 administrations across more than 2,000 patients.

Inovio's corporate strategy is to advance, protect, and provide its novel DNA medicines to meet urgent and emerging global health needs. The Company continues to advance and validate an array of DNA medicine candidates that target HPV-related diseases, cancer, and infectious diseases. The Company aims to advance these candidates through commercialization and continue to leverage third-party resources through collaborations and partnerships, including product license agreements.

The Company's partners and collaborators include ApolloBio Corp., AstraZeneca, Beijing Advaccine, The Bill & Melinda Gates Foundation, Coalition for Epidemic Preparedness Innovations (CEPI), Defense Advanced Research Projects Agency (DARPA), GeneOne Life Science, HIV Vaccines Trial Network, the U.S. Defense Threat Reduction Agency's Medical CBRN Defense Consortium (MCDC), National Cancer Institute, National Institutes of Health, National Institute of Allergy and Infectious Diseases, Plumline Life Sciences, Regeneron Pharmaceuticals, Inc., Roche/Genentech, the University of Pennsylvania, the Walter Reed Army Institute of Research, and The Wistar Institute.

The Company and its collaborators are currently conducting or planning clinical studies of its DNA medicines for HPV-associated precancers, including cervical, vulvar, and anal dysplasia; HPV-associated cancers, including head & neck, cervical, anal, penile, vulvar, and vaginal; other HPV-associated disorders, such as recurrent respiratory papillomatosis (RRP); glioblastoma multiforme (GBM); prostate cancer; HIV; Ebola; Middle East Respiratory Syndrome (MERS); Lassa fever; Zika virus; and the COVID-19 virus (coronavirus).

Inovio was incorporated in Delaware in June 2001 and has its principal executive offices in Plymouth Meeting, Pennsylvania.

2. Summary of Significant Accounting Policies

Basis of Presentation

Inovio incurred a net loss attributable to common stockholders of \$119.4 million for the year ended December 31, 2019. Inovio had working capital of \$62.2 million and an accumulated deficit of \$739.8 million as of December 31, 2019. The Company has incurred losses in each year since its inception and expects to continue to incur significant expenses and operating losses for the foreseeable future in connection with the research and preclinical and clinical development of its product candidates. During the year ended December 31, 2019, the Company received net proceeds of \$75.7 million from a private placement of \$78.5 million aggregate principal amount of its 6.50% convertible senior notes due 2024 (the "Notes"), net proceeds of \$14.5 million from the private placement of 18 billion Korean Won (KRW) (approximately USD \$15.0 million based on the exchange rate on the date of issuance) aggregate principal amount of its 1.0% convertible bonds due August 2024 (the "August 2019 Bonds"), net proceeds of \$4.0 million from the private placement of 4.7 billion KRW (approximately USD \$4.1 million based on the exchange rate on the date of issuance) aggregate principal amount of its 1.0% convertible bonds due December 2024 (the "December 2019 Bonds" and, collectively with the August 2019 Bonds, the "Bonds") and net proceeds of \$9.1 million from sales of common stock under its At-the-Market Equity Offering Sales Agreement with Stifel, Nicolaus & Company (the "Sales Agreement"). As described in Note 19 below, the Sales Agreement was amended subsequent to December 31, 2019. From January 1, 2020 through March 11, 2020, the Company sold 43,148,952 shares of common stock under the Sales Agreement, as amended, for net proceeds of \$208.2 million. These proceeds, in addition to the Company's cash, cash equivalents and short-term investments of \$89.5 million and long-term investments of \$6.3 million as of December 31, 2019,

are sufficient to support the Company's operations for a period of at least 12 months from the date it issued these financial statements.

In order to continue to fund future research and development activities, the Company will need to seek additional capital. This may occur through strategic alliance and licensing arrangements and/or future public or private debt or equity financings including use of its Sales Agreement. However, sufficient funding may not be available in the future, or if available, may be on terms that significantly dilute or otherwise adversely affect the rights of existing stockholders. If adequate funds are not available, the Company may need to delay, reduce the scope of or put on hold one or more of its clinical and/or preclinical programs.

In July 2019, the Company announced a strategic organizational restructuring. In order to reduce operating expenses and conserve cash resources, the Company reduced its workforce by approximately 28% and discontinued its Phase 1/2 clinical trial of its immuno-oncology product candidate INO-5401 in patients with advanced bladder cancer. In the third quarter of 2019, the Company incurred a personnel-related restructuring charge of \$2.2 million in connection with one-time employee termination costs, including severance and other benefits, all of which have been paid as of December 31, 2019.

The Company's ability to continue its operations is dependent upon its ability to obtain additional capital in the future and achieve profitable operations. The Company expects to continue to rely on outside sources of financing to meet its capital needs and the Company may never achieve positive cash flow. These consolidated financial statements do not include any adjustments to the specific amounts and classifications of assets and liabilities, which might be necessary should Inovio be unable to continue as a going concern. Inovio's consolidated financial statements as of and for the year ended December 31, 2019 have been prepared on a going concern basis, which contemplates the realization of assets and the settlement of liabilities and commitments in the normal course of business for the foreseeable future. The Company has evaluated subsequent events after the balance sheet date through the date it issued these financial statements.

Consolidation

These consolidated financial statements include the accounts of Inovio Pharmaceuticals, Inc. and its subsidiaries. The Company consolidates its wholly-owned subsidiaries Genetronics, Inc. and VGX Pharmaceuticals Inc. ("VGX"), and records a non-controlling interest for 39% of its subsidiary Geneos Therapeutics, Inc. ("Geneos") as well as 15% of VGX Animal Health, Inc., a subsidiary of VGX. All intercompany accounts and transactions have been eliminated upon consolidation.

Segment Reporting

Operating segments are identified as components of an enterprise about which separate discrete financial information is available for evaluation by the chief operating decision-maker in making decisions regarding resource allocation and assessing performance. The Company views its operations and manages its business as one segment operating primarily within the United States.

Use of Estimates

The preparation of consolidated financial statements in conformity with U.S. GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities, disclosures of contingent assets and liabilities at the date of the consolidated financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from those estimates.

Concentration of Credit Risk

Financial instruments that potentially subject the Company to concentrations of credit risk consist primarily of cash and short-term investments. The Company limits its exposure to credit loss by placing its cash and investments with high credit quality financial institutions. Additionally, the Company has established guidelines regarding diversification of its investments and their maturities which are designed to maintain principal and maximize liquidity.

The Company has contracts with certain of its customers that have represented more than 10% of the Company's total revenues, as discussed in Note 7.

Fair value of Financial Instruments

The Company's financial instruments consist principally of cash equivalents, short-term investments and investments in affiliated entities. The carrying amounts of cash equivalents approximate the related fair values due to the short-term maturities of these instruments. Investments are recorded at fair value, based on current market valuations. After the adoption of Accounting Standards Update ("ASU") No. 2016-01 on January 1, 2018, unrealized gains and losses on the Company's equity investment in its affiliated entity Plumblin Life Sciences, Inc. ("PLS") are reported in the consolidated statement of operations as a gain (loss) on investment in affiliated entities. The Company's investment in GeneOne, an affiliated entity, is accounted for at fair value on a recurring basis, with changes in fair value recorded on the consolidated statements of operations within gain (loss) from investment in affiliated entity. The Company carries convertible notes and bonds at face value less unamortized debt

discount and issuance costs on its consolidated balance sheet, and it presents the fair value of such convertible notes and bonds for disclosure purposes only.

Cash and Cash Equivalents

Cash equivalents are considered by the Company to be highly liquid investments purchased with original maturities of three months or less from the date of purchase. Cash and cash equivalents included certain money market accounts at December 31, 2019 and 2018.

Investments

The Company defines investments as income-yielding securities that can be readily converted into cash or equity investments classified as available-for-sale. Investments included mutual funds and equity investments in the Company's affiliated entities, PLS and GeneOne, at December 31, 2019. Investments included mutual funds, United States corporate debt securities and an equity investment in the Company's affiliated entities, PLS and GeneOne, at December 31, 2018.

Accounts Receivable

Accounts receivable are recorded at invoiced amounts and do not bear interest. The Company performs ongoing credit evaluations of its customers' financial condition. Credit is extended to customers as deemed necessary and generally does not require collateral. Management believes that the risk of loss is significantly reduced due to the quality and financial position of the Company's customers. No allowance for doubtful accounts was deemed necessary at December 31, 2019 and 2018.

Fixed Assets

Property and equipment are stated at cost and depreciated using the straight-line method over the estimated useful life of the assets, generally three to five years. Leasehold improvements are amortized over the shorter of the remaining term of the related leases or the estimated economic useful lives of the improvements. Repairs and maintenance are expensed as incurred.

Long-Lived Assets

All long-lived assets are reviewed for impairment in value when changes in circumstances dictate, based upon undiscounted future operating cash flows, and appropriate losses are recognized and reflected in current earnings, to the extent the carrying amount of an asset exceeds its estimated fair value determined by the use of appraisals, discounted cash flow analyses or comparable fair values of similar assets. The Company has not recognized any losses on long-lived assets through December 31, 2019.

Valuation of Intangible Assets and Goodwill

Intangible assets are amortized over their estimated useful lives ranging from two to 18 years. Acquired intangible assets are continuously being developed for the future economic viability contemplated at the time of acquisition. The Company is concurrently conducting preclinical studies and clinical trials using the acquired intangibles and has entered into licensing agreements for the use of these acquired intangibles.

Historically, the Company has recorded patents at cost and amortized these costs using the straight-line method over the expected useful lives of the patents or 17 years, whichever is less. Patent cost consists of the consideration paid for patents and related legal costs. Effective as of the acquisition of VGX in 2009, all new patent costs are expensed as incurred, with patent costs capitalized as of that date continuing to be amortized over the expected life of the patent. License costs are recorded based on the fair value of consideration paid and are amortized using the straight-line method over the shorter of the expected useful life of the underlying patents or the term of the related license agreement to the extent the license has an alternative future use. As of December 31, 2019 and 2018, the Company's intangible assets resulting from the acquisition of VGX, as well as the acquisitions of two other companies, Inovio AS and Bioject Medical Technologies, Inc. ("Bioject"), and additional intangibles including previously capitalized patent costs and license costs, net of accumulated amortization, totaled \$3.7 million and \$4.8 million, respectively.

The determination of the value of intangible assets requires management to make estimates and assumptions that affect the Company's consolidated financial statements. The Company assesses potential impairments to intangible assets when there is evidence that events or changes in circumstances indicate that the carrying amount of an asset may not be recovered. The Company's judgments regarding the existence of impairment indicators and future cash flows related to intangible assets are based on operational performance of its acquired businesses, market conditions and other factors. If impairment is indicated, the Company will reduce the carrying value of the intangible asset to fair value. While current and historical operating and cash flow losses are potential indicators of impairment, the Company believes the future cash flows to be received from its intangible assets will exceed the intangible assets' carrying value, and accordingly, the Company has not recognized any impairment losses through December 31, 2019.

Goodwill represents the excess of acquisition cost over the fair value of the net assets of acquired businesses. Goodwill is reviewed for impairment at least annually at November 30, or more frequently if an event occurs indicating the potential for

impairment. During its goodwill impairment review, the Company may assess qualitative factors to determine whether it is more likely than not that the fair value of its reporting unit is less than its carrying amount, including goodwill. The qualitative factors include, but are not limited to, macroeconomic conditions, industry and market considerations, and the overall financial performance of the Company. If, after assessing the totality of these qualitative factors, the Company determines that it is not more likely than not that the fair value of its reporting unit is less than its carrying amount, then no additional assessment is deemed necessary. Otherwise, the Company proceeds to perform the two-step test for goodwill impairment. The first step involves comparing the estimated fair value of the reporting unit with its carrying value, including goodwill. If the carrying amount of the reporting unit exceeds its fair value, the Company performs the second step of the goodwill impairment test to determine the amount of loss, which involves comparing the implied fair value of the goodwill to the carrying value of the goodwill. The Company may also elect to bypass the qualitative assessment in a period and elect to proceed to perform the first step of the goodwill impairment test. The Company performed its annual assessment for goodwill impairment as of November 30, 2019, identifying no impairment.

Although there are inherent uncertainties in this assessment process, the estimates and assumptions the Company is using are consistent with its internal planning. If these estimates or their related assumptions change in the future, the Company may be required to record an impairment charge on all or a portion of its goodwill and intangible assets. Furthermore, the Company cannot predict the occurrence of future impairment triggering events nor the impact such events might have on its reported asset values. Future events could cause the Company to conclude that impairment indicators exist and that goodwill or other intangible assets associated with its acquired businesses are impaired. Any resulting impairment loss could have an adverse impact on the Company's results of operations. See Note 9 for further discussion of the Company's goodwill and intangible assets.

Income Taxes

The Company recognizes deferred tax assets and liabilities for temporary differences between the financial reporting basis and the tax basis of the Company's assets and liabilities along with net operating loss and tax credit carry forwards. The Company records a valuation allowance against its deferred tax assets to reduce the net carrying value to an amount that it believes is more likely than not to be realized. When the Company establishes or reduces the valuation allowance against its deferred tax assets, its provision for income taxes will increase or decrease, respectively, in the period such determination is made.

Valuation allowances against the Company's deferred tax assets were \$137.2 million and \$115.0 million at December 31, 2019 and 2018, respectively. Changes in the valuation allowances, when they are recognized in the provision for income taxes, are included as a component of the estimated annual effective tax rate.

Collaboration Agreements

The Company assesses whether its collaboration agreements are subject to Accounting Standards Codification ("ASC") 808: Collaborative Arrangements ("Topic 808") based on whether they involve joint operating activities and whether both parties have active participation in the arrangement and are exposed to significant risks and rewards. To the extent that the arrangement falls within the scope of Topic 808, the Company assesses whether the payments between the Company and the collaboration partner are subject to other accounting literature. If payments from the collaboration partner to the Company represent consideration from a customer, then the Company accounts for those payments within the scope of Topic 606. However, if the Company concludes that its collaboration partner is not a customer for certain activities, such as for certain collaborative research and development activities, the Company presents such payments as a reduction of research and development expense.

Revenue Recognition

Effective January 1, 2018, the Company adopted ASU 2014-09, *Revenue from Contracts with Customers* ("Topic 606") using the modified retrospective method which consisted of applying and recognizing the cumulative effect of Topic 606 at the date of initial application.

The Company recognizes revenue when it transfers promised goods or services to customers in an amount that reflects the consideration to which it expects to be entitled in exchange for those goods or services. To determine revenue recognition for contracts with customers, the Company performs the following five steps: (i) identify the contract(s) with a customer; (ii) identify the performance obligations in the contract; (iii) determine the transaction price; (iv) allocate the transaction price to the performance obligations in the contract; and (v) recognize revenue when (or as) the Company satisfies its performance obligations. At contract inception, the Company assesses the goods or services agreed upon within each contract and assess whether each good or service is distinct and determine those that are performance obligations. The Company then recognizes as revenue the amount of the transaction price that is allocated to the respective performance obligation when (or as) the performance obligation is satisfied.

Collaborative Arrangements

The Company enters into collaborative arrangements with partners that typically include payment of one or more of the following: (i) license fees; (ii) product supply services; (iii) milestone payments related to the achievement of developmental, regulatory, or commercial goals; and (iv) royalties on net sales of licensed products. Where a portion of non-refundable, upfront fees or other payments received are allocated to continuing performance obligations under the terms of a collaborative arrangement, they are recorded as deferred revenue and recognized as revenue when (or as) the underlying performance obligation is satisfied.

As part of the accounting for these arrangements, the Company must develop estimates and assumptions that require judgment of management to determine the underlying stand-alone selling price for each performance obligation which determines how the transaction price is allocated among the performance obligation. The stand-alone selling price may include items such as forecasted revenues, development timelines, discount rates and probabilities of technical and regulatory success. The Company evaluates each performance obligation to determine if it can be satisfied at a point in time or over time. In addition, variable consideration must be evaluated to determine if it is constrained and, therefore, excluded from the transaction price.

License Fees

If a license to intellectual property is determined to be distinct from the other performance obligations identified in the arrangement, the Company recognizes revenues from non-refundable, up-front fees allocated to the license when the license is transferred to the licensee and the licensee is able to use and benefit from the license. For licenses that are bundled with other promises, the Company utilizes judgment to assess the nature of the combined performance obligation to determine whether the combined performance obligation is satisfied over time or at a point in time and, if over time, the appropriate method of measuring progress for purposes of recognizing revenue. The Company evaluates the measure of progress each reporting period and, if necessary, adjusts the measure of performance and related revenue recognition.

Product Supply Services

Arrangements that include a promise for future supply of drug product for either clinical development or commercial supply at the licensee's discretion are generally considered as options. The Company assesses if these options provide a material right to the licensee and if so, they are accounted for as separate performance obligations. The Company evaluates whether it is the principal or agent in the arrangement. The Company had determined that it is the principal in the current arrangements as the Company controls the product supply before it is transferred to the customer.

Milestone Payments

At the inception of each arrangement that includes milestone payments (variable consideration), the Company evaluates whether the milestones are considered probable of being reached and estimates the amount to be included in the transaction price using the most likely amount method. If it is probable that a significant revenue reversal would not occur, the associated milestone value is included in the transaction price. Milestone payments that are not within the Company's or its collaboration partner's control, such as regulatory approvals, are generally not considered probable of being achieved until those approvals are received. The transaction price is then allocated to each performance obligation on a relative stand-alone selling price basis, for which the Company recognizes revenue as or when the performance obligations under the contract are satisfied. At the end of each subsequent reporting period, the Company re-evaluates the probability of achieving such milestones and any related constraint, and if necessary, adjusts its estimate of the overall transaction price. Any such adjustments are recorded on a cumulative catch-up basis, which would affect license, collaboration or other revenues and earnings in the period of adjustment.

Royalties

For arrangements that include sales-based royalties, including milestone payments based on the level of sales, and for which the license is deemed to be the predominant item to which the royalties relate, the Company recognizes revenue at the later of (i) when the related sales occur, or (ii) when the performance obligation to which some or all of the royalty has been allocated has been satisfied (or partially satisfied). To date, the Company has not recognized any royalty revenue resulting from any of its collaborative arrangements.

Grants

The Company has determined that as of January 1, 2018, accounting for the Company's various grant agreements falls under the contributions guidance under Subtopic 958-605, *Not-for-Profit Entities-Revenue Recognition*, which is outside the scope of Topic 606, as the government agencies granting the Company funds are not receiving reciprocal value for their contributions. Beginning on January 1, 2018, all contributions received from current grant agreements are recorded as a contra- expense as opposed to revenue on the consolidated statement of operations.

Derivative Liabilities

The Company evaluates its debt and equity issuances to determine if those contracts or embedded components of those contracts qualify as derivatives requiring separate recognition in the Company's financial statements. The result of this accounting treatment is that the fair value of the embedded derivative is revalued at each balance sheet date and recorded as a liability, and the change in fair value during the reporting period is recorded in other income (expense) in the consolidated statements of operations. In circumstances where the embedded conversion option in a convertible instrument is required to be bifurcated and there are also other embedded derivative instruments in the convertible instrument that are required to be bifurcated, the bifurcated derivative instruments are accounted for as a single, compound derivative instrument. The classification of derivative instruments, including whether such instruments should be recorded as liabilities or as equity, is reassessed at the end of each reporting period. Derivative instrument liabilities are classified in the balance sheet as current or non-current based on whether or not net-cash settlement of the derivative instrument is expected within twelve months of the balance sheet date.

Foreign Currency Transactions

The functional and presentation currency of the Company is the U.S. dollar. Transactions denominated in a currency other than the functional currency are recorded on the initial recognition at the exchange rate at the date of the transaction. After initial recognition, monetary assets and liabilities denominated in foreign currency are remeasured at the end of each reporting period into the functional currency at the exchange rate at that date. Exchange differences are included in general and administrative expenses in the consolidated statement of operations. Non-monetary assets and liabilities measured at cost are remeasured at the exchange rate at the date of the transaction.

Research and Development Expenses

The Company's activities have largely consisted of research and development efforts related to developing electroporation delivery technologies and DNA immunotherapies and vaccines. Research and development expenses consist of expenses incurred in performing research and development activities including salaries and benefits, facilities and other overhead expenses, clinical trials, contract services and other outside expenses. Research and development expenses are charged to operations as they are incurred. These expenses result from the Company's independent research and development efforts as well as efforts associated with collaborations and licensing arrangements. The Company reviews and accrues clinical trial expense based on work performed, which relies on estimates of total costs incurred based on patient enrollment, completion of studies and other events. The Company follows this method since reasonably dependable estimates of the costs applicable to various stages of a research agreement or clinical trial can be made. Accrued clinical trial costs are subject to revisions as trials progress. Revisions are charged to expense in the period in which the facts that give rise to the revision become known. Historically, revisions have not resulted in material changes to research and development expense; however, a modification in the protocol of a clinical trial or cancellation of a trial could result in a charge to the Company's results of operations.

Net Loss Per Share

Basic net loss per share is computed by dividing the net loss for the year by the weighted average number of common shares outstanding during the year. Diluted net loss per share is calculated in accordance with the treasury stock method for the outstanding stock options, restricted stock units and warrants and reflects the potential dilution that would occur if securities or other contracts to issue common stock were exercised or converted to common stock. For the year ended December 31, 2019, the dilutive impact of the outstanding Notes and Bonds issued by the Company (discussed in Note 10) has been considered using the "if-converted" method. The calculation of diluted net loss per share requires that, to the extent the average market price of the underlying shares for the reporting period exceeds the exercise price of the options or other securities and the presumed exercise of such securities are dilutive to net loss per share for the period, an adjustment to net loss used in the calculation is required to remove the change in fair value of such securities from the numerator for the period. Likewise, an adjustment to the denominator is required to reflect the related dilutive shares, if any.

The following tables reconcile the components of the numerator and denominator included in the calculations of diluted net loss per share:

	Year Ended December 31,		
	2019	2018	2017
Numerator			
Net loss attributable to Inovio Pharmaceuticals, Inc. (numerator for use in basic net loss per share)	\$ (119,359,219)	\$ (96,967,830)	\$ (88,205,772)
Adjustment for decrease in fair value of warrant liability	—	—	(806,819)
Numerator for use in diluted net loss per share	<u>\$ (119,359,219)</u>	<u>\$ (96,967,830)</u>	<u>\$ (89,012,591)</u>
Denominator			
Weighted average number of common shares outstanding (denominator for use in basic net loss per share)	98,717,999	92,539,997	81,777,493
Effect of dilutive potential common shares	—	—	140,529
Denominator for use in diluted net loss per share	<u>98,717,999</u>	<u>92,539,997</u>	<u>81,918,022</u>
Net loss per share, diluted	<u>\$ (1.21)</u>	<u>\$ (1.05)</u>	<u>\$ (1.09)</u>
Net loss per share, basic	<u>\$ (1.21)</u>	<u>\$ (1.05)</u>	<u>\$ (1.08)</u>

The following table summarizes potential shares of common stock that were excluded from diluted net loss per share calculation because of their anti-dilutive effect:

	Year Ended December 31,		
	2019	2018	2017
Options to purchase common stock	9,265,390	8,752,677	7,694,870
Restricted stock units	2,069,936	1,688,017	1,234,168
Convertible preferred stock	8,456	8,456	8,456
Convertible notes	14,585,653	—	—
August 2019 Bonds	3,799,071	—	—
December 2019 Bonds	1,009,450	—	—
Total	<u>30,737,956</u>	<u>10,449,150</u>	<u>8,937,494</u>

Leases

The Company adopted ASU 2016-02, *Leases (Topic 842)* (“Topic 842”) on January 1, 2019. For long-term operating leases, the Company recognized an operating lease right-of-use asset and an operating lease liability on its consolidated balance sheets. The lease liability is determined as the present value of future lease payments using an estimated rate of interest that the Company would pay to borrow equivalent funds on a collateralized basis at the lease commencement date. The right-of-use asset is based on the liability adjusted for any prepaid or deferred rent. The Company determined the lease term at the commencement date by considering whether renewal options and termination options are reasonably assured of exercise.

Fixed rent expense for the Company's operating leases is recognized on a straight-line basis over the term of the lease and is included in operating expenses on the consolidated statements of operations. Variable lease payments including lease operating expenses are recorded as incurred.

Prior period amounts continue to be reported in accordance with the historic accounting under the previous lease guidance, ASC 840, *Leases (Topic 840)*. See “Recent Accounting Pronouncements - Recently Adopted” below, for more information about the impact of the adoption of Topic 842.

Stock-Based Compensation

The Company incurs stock-based compensation expense related to restricted stock units and stock options. The fair value of restricted stock is determined by the closing price of the Company's common stock reported on the Nasdaq Global Select Market on the date of grant. The Company estimates the fair value of stock options granted using the Black-Scholes option pricing model. The Black-Scholes option pricing model was developed for use in estimating the fair value of traded options, which have no vesting restrictions and are fully transferable. In addition, option valuation models require the input of subjective assumptions, including the expected stock price volatility and expected option life. The Company amortizes the fair value of the awards on a straight-line basis over the requisite vesting period of the awards. Expected volatility is based on historical

volatility. The expected life of options granted is based on historical expected life. The risk-free interest rate is based on the U.S. Treasury yield in effect at the time of grant. The dividend yield is based on the fact that no dividends have been paid historically and none are currently expected to be paid in the foreseeable future. The Company recognizes forfeitures as they occur.

The weighted average assumptions used in the Black-Scholes model for option grants to employees and directors are presented below:

	Year Ended December 31,		
	2019	2018	2017
Risk-free interest rate	2.42%	2.73%	2.20%
Expected volatility	70%	72%	73%
Expected life in years	6	6	6
Dividend yield	—	—	—

The Company adopted ASU 2018-07 on January 1, 2019, which generally aligned the accounting for stock-based compensation for non-employees with that of employees. The fair value of the stock options granted to non-employees was estimated using the Black-Scholes pricing model.

The weighted average assumptions used in the Black-Scholes model for option grants to non-employees are presented below:

	Year Ended December 31,		
	2019	2018	2017
Risk-free interest rate	2.45%	2.71%	2.42%
Expected volatility	88%	78%	99%
Expected life in years	10	9	9
Dividend yield	—	—	—

Recent Accounting Pronouncements - Recently Adopted

The recent accounting pronouncements below may have a significant effect on the Company's financial statements. Recent accounting pronouncements that are not anticipated to have an impact on or are unrelated to the Company's financial condition, results of operations, or related disclosures are not discussed.

ASU No. 2016-02. In February 2016, the FASB issued Topic 842, which requires lessees to recognize most leases on the balance sheet as lease liabilities with corresponding right-of-use assets and to disclose key information about leasing arrangements. The Company adopted the new lease standard on January 1, 2019 using the modified retrospective approach. The Company elected the available package of practical expedients upon adoption, which allowed the Company to carry forward its historical assessment of whether existing agreements contained a lease and the classification of its existing operating leases. Upon adoption, the Company recognized an operating right-of-use asset and operating lease liability in its consolidated balance sheet of approximately \$14.6 million and \$24.2 million, respectively. The Company also classified deferred rent of \$9.6 million as an offset to the Company's operating right-of-use asset upon adoption. There were no adjustments to the Company's opening accumulated deficit balance upon adoption.

The impact of the adoption of Topic 842 on the consolidated balance sheets as of January 1, 2019 was as follows:

	ASC 840		Topic 842
	January 1, 2019	Impact of Adoption	January 1, 2019
Deferred rent, current portion	\$ 1,065,387	\$ (1,065,387)	\$ —
Deferred rent, non-current portion	\$ 8,518,207	\$ (8,518,207)	\$ —
Operating right-of-use assets	\$ —	\$ 14,634,769	\$ 14,634,769
Operating lease liability, current portion	\$ —	\$ 1,733,600	\$ 1,733,600
Operating lease liability, non-current portion	\$ —	\$ 22,484,763	\$ 22,484,763

ASU No. 2018-07. In June 2018, the FASB issued ASU 2018-07, *Compensation—Stock Compensation (Topic 718), Improvements to Nonemployee Share-Based Payment Accounting*, that simplifies the accounting for stock-based payments granted to non-employees for services by generally aligning it with the accounting for stock-based payments granted to

employees. The Company adopted the standard on January 1, 2019 and there was no material impact to its consolidated financial statements.

ASU No. 2018-13. In August 2018, the FASB issued ASU 2018-13, *Fair Value Measurement Disclosure Framework—Changes to the Disclosure Requirements for Fair Value Measurement*, which amends certain disclosure requirements over Level 1, Level 2 and Level 3 fair value measurements (see Note 6 for more information about the Company's fair value classifications). ASU 2018-13 is effective for fiscal years beginning after December 15, 2019 and interim periods within those fiscal years. Early adoption is permitted. The Company does not expect the adoption of this standard to have a material impact on its disclosures.

Recent Accounting Pronouncements - Not Yet Adopted

ASU No. 2016-13. In June 2016, the FASB issued ASU 2016-13, *Financial Instruments - Credit Losses: Measurement of Credit Losses on Financial Instruments (Topic 326)*, which amends the impairment model by requiring entities to use a forward-looking approach based on expected losses to estimate credit losses on certain types of financial instruments, including trade receivables and available for sale debt securities. ASU 2016-13 is effective beginning in the first quarter of 2020, with early adoption permitted. The Company is currently evaluating the impact of this ASU on its consolidated financial statements. This standard includes the Company's financial instruments, such as accounts receivable and investments that are generally of high credit quality. Previously, when credit losses were measured under GAAP, an entity generally only considered past events and current conditions in measuring the incurred loss. The new guidance requires the Company to identify, analyze, document and support new methodologies for quantifying expected credit loss estimates for its financial instruments, using information such as historical experience and current economic conditions, plus the use of reasonable supportable forecast information.

ASU No. 2018-18. In November 2018, the FASB issued ASU 2018-18, *Collaborative Arrangements (Topic 808): Clarifying the Interaction between Topic 808 and Topic 606*, which clarified the interaction between Topic 808, *Collaborative Arrangements*, and Topic 606, *Revenue from Contracts with Customers*. ASU 2018-18 is effective for fiscal years beginning after December 15, 2019, and interim periods within those fiscal years. Early adoption is permitted. The adoption of this standard is not expected to have a material impact on the financial statements.

ASU 2017-04. In January 2017, the FASB issued ASU 2017-04, *Intangibles - Goodwill and Other (Topic 350): Simplifying the Test for Goodwill Impairment* ("ASU 2017-04"). ASU 2017-04 simplifies the recognition and measurement of a goodwill impairment loss by eliminating Step 2 of the quantitative goodwill impairment test. The guidance requires a one-step impairment test in which an entity compares the fair value of a reporting unit with its carrying amount and recognizes an impairment charge for the amount by which the carrying amount exceeds the reporting unit's fair value, if any. ASU 2017-04 is effective for fiscal years beginning after December 15, 2019 and should be applied on a prospective basis. The Company adopted this guidance on January 1, 2020, and it believes the adoption of this guidance will not have a material impact on its consolidated financial statements or related disclosures.

3. Revenue Recognition

During the year ended December 31, 2019, the Company recognized total revenue under collaborative research and development and other agreements determined to be contracts with a customer of \$3.2 million from AstraZeneca and \$917,000 from various other contracts. The Company defers revenue when a contract is entered into with a collaborator and cash payments are received prior to satisfaction of the related performance obligation. Of the total revenue recognized during the year ended December 31, 2019, \$293,000 was in deferred revenue as of December 31, 2018. During the year ended December 31, 2018, the Company recognized revenue of \$1.3 million that was included in deferred revenue at December 31, 2017. Performance obligations are generally satisfied within 12 months of the initial contract date.

4. Collaborative Agreements

ApolloBio Corporation

On December 29, 2017, the Company entered into an Amended and Restated License and Collaboration Agreement (the "ApolloBio Agreement"), with ApolloBio Corporation ("ApolloBio"), with an effective date of March 20, 2018. Under the terms of the ApolloBio Agreement, the Company granted to ApolloBio the exclusive right to develop and commercialize VGX-3100, its DNA immunotherapy product designed to treat pre-cancers caused by HPV, within the territories of China, Hong Kong, Macao, Taiwan, and may include Korea in the event that no patent covering VGX-3100 is issued in China within the three years following the effective date of the ApolloBio Agreement.

Under the ApolloBio Agreement, the Company received proceeds of \$19.4 million in March 2018, which comprised the upfront payment of \$23.0 million less \$2.2 million in foreign income taxes and \$1.4 million in certain foreign non-income taxes. The foreign income taxes were recorded as a provision for income taxes and the foreign non-income taxes were recorded as a general and administrative expense, on the consolidated statement of operations during the quarter ended March 31, 2018. The Company also incurred advisory fees of \$960,000 in connection with receiving the upfront payment from ApolloBio.

These fees were determined to be incremental costs of obtaining the contract. The Company applied the practical expedient that permits a company to expense incremental costs to obtain a contract when the expected amortization period is one year or less and recorded the fees in general and administrative expense during the quarter ended March 31, 2018. No additional advisory fees are due related to the ApolloBio Agreement.

In addition to the upfront payment, the Company is entitled to receive up to an aggregate of \$20.0 million, less required income, withholding or other taxes, upon the achievement of specified milestones related to the regulatory approval of VGX-3100 in the United States, China and Korea. In the event that VGX-3100 is approved for marketing, the Company will be entitled to receive royalty payments based on a tiered percentage of annual net sales, with such percentage being in the low- to mid-teens, subject to reduction in the event of generic competition in a particular territory. ApolloBio's obligation to pay royalties will continue for 10 years after the first commercial sale in a particular territory or, if later, until the expiration of the last-to-expire patent covering the licensed products in the specified territory.

The Company evaluated the terms of the ApolloBio Agreement under Topic 606, and the license to VGX-3100 in the territories was identified as the only distinct performance obligation on a standalone basis as of the inception of the agreement. The Company concluded that the license was distinct from potential future manufacturing and supply obligations. The Company further determined that the transaction price under the agreement consisted of the \$23.0 million upfront payment. The future potential milestone amounts were not included in the transaction price, as they were all determined to be fully constrained. As part of the evaluation of the development and regulatory milestones constraint, the Company determined that the achievement of such milestones is contingent upon success in future clinical trials and regulatory approvals, each of which is uncertain at this time. Future potential milestone amounts may be recognized as revenue under the ApolloBio Agreement, as well as under other collaborative research and development arrangements, if unconstrained. Reimbursable program costs will be recognized proportionately with the performance of the underlying services or delivery of drug supply and are excluded from the transaction price.

The ApolloBio Agreement will continue in force until ApolloBio has no remaining royalty obligations. Either party may terminate the ApolloBio Agreement in the event the other party shall materially breach or default in the performance of its material obligations thereunder and such default continues for a specified period after written notice thereof. In addition, ApolloBio may terminate the ApolloBio Agreement at any time beginning one year after the effective date for any reason upon 90 days written notice to the Company.

Under Topic 606, the entire transaction price of \$23.0 million was allocated to the license performance obligation. The Company determined that during the quarter ended June 30, 2018, the transfer of technology occurred and accordingly, the performance obligation was fully satisfied. The Company has recorded the gross upfront payment received from ApolloBio of \$23.0 million as revenue under collaborative research and development arrangements on the consolidated statement of operations during the year ended December 31, 2018.

AstraZeneca

On August 7, 2015, the Company entered into a license and collaboration agreement with MedImmune, the global biologics research and development arm of AstraZeneca ("AstraZeneca"). Under the agreement, AstraZeneca acquired exclusive rights to the Company's INO-3112 immunotherapy, renamed as MEDI0457, which targets cancers caused by human papillomavirus (HPV) types 16 and 18, with the ability to sublicense those license rights. AstraZeneca made an upfront payment of \$27.5 million to the Company in September 2015. AstraZeneca may be obligated to make potential future development and regulatory event-based payments to the Company totaling up to \$125 million and potential future commercial event-based payments totaling up to \$115 million, in each case upon the achievement of specified milestones related to MEDI0457 set forth in the license and collaboration agreement. AstraZeneca will fund all development costs associated with MEDI0457 immunotherapy. The Company is entitled to receive up to mid-single to double-digit tiered royalties on MEDI0457 product sales. Under the agreement, AstraZeneca can also request the Company to provide certain clinical manufacturing at an agreed upon price. The Company determined these options did not represent material rights at the inception of the agreement.

Within the broader collaboration, AstraZeneca had rights to co-develop up to two additional DNA-based cancer vaccine product candidates not included in the Company's current product pipeline. The Company has received notice that AstraZeneca intends to discontinue activities with respect to the research collaboration programs, other than MEDI0457, that were covered by the collaboration agreement.

As of December 31, 2017, the Company had recognized all of the \$27.5 million upfront payment as revenue, as all identified material performance obligations had been met with respect to that payment. In both December 2018 and March 2019, the Company recognized as revenue \$2.0 million in milestone payments from AstraZeneca triggered by AstraZeneca's initiation of the Phase 2 portion of ongoing clinical trials in the second and third major indication, respectively, under the agreement. During the year ended December 31, 2019, the Company recognized total revenues of \$3.2 million from AstraZeneca primarily for manufacturing services, for which the Company determined it was the principal in the arrangement as it controlled the product supply before it is transferred to the customer, and the milestone achieved as discussed above. As of

December 31, 2019 and 2018, the Company had an accounts receivable balance of \$161,000 and \$3.2 million, respectively, related to the collaboration agreement with AstraZeneca.

Coalition for Epidemic Preparedness Innovations

On April 11, 2018, the Company entered into agreements with CEPI, pursuant to which the Company intends to develop vaccine candidates against Lassa fever and MERS. The goal of the collaboration between the Company and CEPI is to conduct research and development so that investigational stockpiles will be ready for clinical efficacy trial testing during potential disease outbreaks. The agreements with CEPI contemplate preclinical studies, as well as Phase 1 and Phase 2 clinical trials, occurring over multiple years. As part of the arrangement between the parties, CEPI has agreed to fund up to an aggregate of \$56 million of costs over a five-year period for preclinical studies, as well as planned Phase 1 and Phase 2 clinical trials, to be conducted by the Company and collaborators, with funding from CEPI based on the achievement of identified milestones. During the years ended December 31, 2019 and 2018, the Company received funding of \$6.3 million and \$4.3 million, respectively, related to the CEPI grant and recorded those payments as contra-research and development expense. As of December 31, 2019, the Company had a grant funding liability balance related to the CEPI grant of \$5.0 million recorded as grant funding liability on the consolidated balance sheet related to the CEPI grant.

5. Short-term Investments

Short-term investments at December 31, 2019 consisted of mutual funds. Short-term investments at December 31, 2018 consisted of mutual funds and United States corporate debt securities. Short-term investments are recorded at fair value, based on current market valuations. Unrealized gains and losses on the Company's debt securities are excluded from earnings and reported as a separate component of other comprehensive loss until realized. Realized gains and losses are included in non-operating other income (expense) on the consolidated statements of operations and are derived using the specific identification method for determining the cost of the securities sold. During the years ended December 31, 2019 and 2018, gross realized gain on investments of \$594,000 and \$20,000, respectively, and gross realized loss on investments of \$118,000 and \$1.3 million, respectively, was recorded. No material balances were reclassified out of accumulated other comprehensive income (loss) for the years ended December 31, 2019, 2018 and 2017. Interest and dividends on investments classified as available-for-sale are included in interest income in the consolidated statements of operations. As of December 31, 2019, the Company had 4 available-for-sale securities in a gross unrealized loss position, of which 2 with an aggregate total unrealized loss of \$11,000 were in such position for longer than 12 months.

The following is a summary of available-for-sale securities as of December 31, 2019 and 2018:

	Contractual Maturity (in years)	As of December 31, 2019			
		Cost	Gross Unrealized Gains	Gross Unrealized Losses	Fair Market Value
Mutual funds	---	\$ 66,599,219	\$ 754,709	\$ (15,911)	\$ 67,338,017

	Contractual Maturity (in years)	As of December 31, 2018			
		Cost	Gross Unrealized Gains	Gross Unrealized Losses	Fair Market Value
Mutual funds	---	\$ 57,842,955	\$ —	\$ (528,084)	\$ 57,314,871
US corporate debt securities	Less than 2	224,633	—	(652)	223,981
Total investments		\$ 58,067,588	\$ —	\$ (528,736)	\$ 57,538,852

6. Fair Value Measurements

The guidance regarding fair value measurements establishes a three-tier fair value hierarchy which prioritizes the inputs used in measuring fair value. These tiers include: Level 1, defined as observable inputs such as quoted prices in active markets that are accessible at the measurement date; Level 2, defined as inputs other than quoted prices in active markets that are either directly or indirectly observable; and Level 3, defined as unobservable inputs in which little or no market data exists, therefore requiring an entity to develop its own assumptions.

Assets and liabilities are classified based on the lowest level of input that is significant to the fair value measurements. The Company reviews the fair value hierarchy classification on a quarterly basis. Changes in the ability to observe valuation inputs may result in a reclassification of levels for certain securities within the fair value hierarchy. The Company did not have any transfer of assets and liabilities between Level 1, Level 2 and Level 3 of the fair value hierarchy during the years ended December 31, 2019 and 2018.

The following table presents the Company's assets and liabilities that are measured at fair value on a recurring basis, and are determined using the following inputs as of December 31, 2019:

	Fair Value Measurements at December 31, 2019			
	Total	Quoted Prices in Active Markets (Level 1)	Significant Other Unobservable Inputs (Level 2)	Significant Unobservable Inputs (Level 3)
Assets:				
Money market funds	\$ 2,349,729	\$ 2,349,729	\$ —	\$ —
Mutual funds	67,338,017	—	67,338,017	—
Investments in affiliated entities	6,315,356	6,315,356	—	—
Total assets	\$ 76,003,102	\$ 8,665,085	\$ 67,338,017	\$ —
Liabilities:				
Derivative liability (Note 10)	\$ 8,819,023	\$ —	\$ —	\$ 8,819,023
Total liabilities	\$ 8,819,023	\$ —	\$ —	\$ 8,819,023

The following table presents the Company's assets that are measured at fair value on a recurring basis, and are determined using the following inputs as of December 31, 2018:

	Fair Value Measurements at December 31, 2018			
	Total	Quoted Prices in Active Markets (Level 1)	Significant Other Unobservable Inputs (Level 2)	Significant Unobservable Inputs (Level 3)
Assets:				
Money market funds	\$ 9,646,507	\$ 9,646,507	\$ —	\$ —
Mutual funds	57,314,871	—	57,314,871	—
US corporate debt securities	223,981	—	223,981	—
Investments in affiliated entities	9,405,913	9,405,913	—	—
Total assets	\$ 76,591,272	\$ 19,052,420	\$ 57,538,852	\$ —

Level 1 assets at December 31, 2019 and 2018 consisted of money market funds held by the Company that are valued at quoted market prices, as well as the Company's investments in its affiliates, GeneOne and PLS. The Company accounts for its investment in 1,644,155 common shares of GeneOne based on the closing price of the shares on the Korean Stock Exchange on the applicable balance sheet date. The Company accounts for its investment in 395,758 common shares of PLS as an equity investment with a fair value based on the closing price of the shares on the Korea New Exchange (KONEX) Market on the applicable balance sheet date. Unrealized gains and losses on the Company's equity securities are reported in the consolidated statement of operations as a gain (loss) on investment in affiliated entities.

Level 2 assets at December 31, 2019 consisted of mutual funds. Level 2 assets at December 31, 2018 consisted of U.S. corporate debt securities and mutual funds. Level 2 assets held by the Company that are initially valued at the transaction price and subsequently valued, at the end of each reporting period, typically utilizing market observable data. The Company obtains the fair value of its Level 2 assets from a professional pricing service, which may use quoted market prices for identical or comparable instruments, or inputs other than quoted prices that are observable either directly or indirectly. The professional pricing service gathers quoted market prices and observable inputs from a variety of industry data providers. The valuation techniques used to measure the fair value of the Company's Level 2 financial instruments were derived from non-binding market consensus prices that are corroborated by observable market data, quoted market prices for similar instruments, or pricing models such as discounted cash flow techniques. The Company validates the quoted market prices provided by the primary pricing service by comparing the service's assessment of the fair values of the Company's investment portfolio balance against the fair values of the Company's investment portfolio balance obtained from an independent source.

In March 2019, August 2019 and December 2019, the Company issued the Convertible Notes, August 2019 Bonds and December 2019 Bonds, respectively. The carrying value of the Notes and Bonds approximates the fair value as December 31, 2019. See Note 10 for additional information.

There were no Level 3 assets held as of December 31, 2019 and 2018.

Level 3 liabilities held at December 31, 2019 consisted of the embedded conversion option contained in the August 2019 Bonds that met the criteria to be bifurcated and accounted for separately from the August 2019 Bonds (the "derivative liability") (see Note 10 below for more information). The derivative liability was recorded at fair value of \$7.1 million upon the issuance of the August 2019 Bonds, and is subsequently remeasured to fair value at each reporting period. The derivative liability was initially valued and remeasured using a "with-and-without" method. The "with-and-without" methodology involves valuing the whole instrument on an as-is basis and then valuing the instrument without the embedded conversion option. The difference between the entire instrument with the embedded conversion option compared to the instrument without the embedded conversion option is the fair value of the derivative, recorded as the derivative liability. There was no derivative liability associated with the issuance of the December 2019 Bonds.

The fair value of the August 2019 Bonds with the conversion option is estimated using a Monte Carlo simulation approach. The key inputs to valuing the August 2019 Bonds with the conversion option on the date of issuance and as of December 31, 2019 include the Company's stock price on the valuation date; the expected annual volatility of the Company's common stock, and the discount yield, which was derived by making the fair value of the August 2019 Bonds equal to the face value on the issuance date. Fair value measurements are highly sensitive to changes in these inputs and significant changes in these inputs could result in a significantly higher or lower fair value.

The following table presents the changes in fair value of the derivative liability for the year ended December 31, 2019:

Balance at December 31, 2018	\$	—
Initial fair value upon issuance of the August 2019 Bonds		7,055,371
Change in fair value		1,763,652
Balance at December 31, 2019	\$	8,819,023

There were no Level 3 liabilities held as of December 31, 2018.

7. Major Customers and Concentration of Credit Risk

<u>Customer</u>	<u>2019 Revenue</u>	<u>% of Total Revenue</u>	<u>2018 Revenue</u>	<u>% of Total Revenue</u>	<u>2017 Revenue</u>	<u>% of Total Revenue</u>
ApolloBio	\$ —	—%	\$ 23,000,000	75%	\$ —	—%
AstraZeneca	3,194,877	78	6,850,424	23	22,269,773	53
DARPA	—	—	—	—	9,983,927	24
Roche	—	—	—	—	6,107,254	14
All other, including affiliated entities	917,053	22	631,473	2	3,859,132	9
Total revenue	\$ 4,111,930	100%	\$ 30,481,897	100%	\$ 42,220,086	100%

During the years ended December 31, 2019 and 2018, the Company recognized revenue from various license fees and collaborative research and development agreements. The Company has determined that as of January 1, 2018, accounting for the Company's various grant agreements falls under the contributions guidance under Subtopic 958-605, *Not-for-Profit Entities-Revenue Recognition*, which is outside the scope of Topic 606. Beginning on January 1, 2018, all contributions received from current grant agreements have been recorded as a contra-expense as opposed to revenue on the consolidated statements of operations, as discussed in Note 2. During the year ended December 31, 2017, the Company recognized revenue from various license fees, collaborative research and development agreements, grants and government contracts. As of December 31, 2019, \$469,000, or 67%, and \$161,000, or 23%, of the Company's accounts receivable was attributable to MCDC and AstraZeneca, respectively. As of December 31, 2018, \$3.2 million, or 98%, of the Company's accounts receivable was attributable to AstraZeneca.

There is minimal credit risk with these customers based upon collection history, their size and financial condition. Accordingly, the Company does not consider it necessary to record a reserve for uncollectible accounts receivable.

8. Fixed Assets

Fixed assets at December 31, 2019 and 2018 consist of the following:

	Cost	Accumulated Depreciation and Amortization	Net Book Value
As of December 31, 2019			
Leasehold improvements	\$ 15,007,935	\$ (4,996,777)	\$ 10,011,158
Laboratory equipment	4,102,467	(3,229,357)	873,110
Office furniture and fixtures	3,048,053	(1,944,293)	1,103,760
Computer equipment and other	3,781,020	(2,996,031)	784,989
	<u>\$ 25,939,475</u>	<u>\$ (13,166,458)</u>	<u>\$ 12,773,017</u>
As of December 31, 2018			
Leasehold improvements	\$ 14,909,341	\$ (3,464,444)	\$ 11,444,897
Laboratory equipment	4,031,965	(2,425,854)	1,606,111
Office furniture and fixtures	3,198,803	(1,767,653)	1,431,150
Computer equipment and other	3,808,824	(2,341,968)	1,466,856
	<u>\$ 25,948,933</u>	<u>\$ (9,999,919)</u>	<u>\$ 15,949,014</u>

Depreciation expense for the years ended December 31, 2019, 2018 and 2017 was \$3.6 million, \$3.7 million and \$1.9 million, respectively. The Company determined that the carrying value of these long-lived assets was not impaired during the periods presented. During the year ended December 31, 2019 the Company disposed of fixed assets with a net book value of \$6,000 and accumulated depreciation of \$432,000.

9. Goodwill and Intangible Assets

The following sets forth goodwill and intangible assets by major asset class:

	Weighted Average Useful Life (Yrs)	December 31, 2019			December 31, 2018		
		Gross	Accumulated Amortization	Net Book Value	Gross	Accumulated Amortization	Net Book Value
Indefinite lived:							
Goodwill(a)		\$ 10,513,371	\$ —	\$ 10,513,371	\$ 10,513,371	\$ —	\$ 10,513,371
Definite lived:							
Patents	10	5,802,528	(5,802,528)	—	5,802,528	(5,742,079)	60,449
Licenses	10	1,323,761	(1,248,104)	75,657	1,323,761	(1,219,357)	104,404
CELLECTRA®(b)	8	8,106,270	(8,106,270)	—	8,106,270	(7,679,190)	427,080
GHRH(b)	11	335,314	(335,314)	—	335,314	(303,630)	31,684
Bioject (c)	12	5,100,000	(2,175,556)	2,924,444	5,100,000	(1,882,222)	3,217,778
Other(d)	18	4,050,000	(3,356,250)	693,750	4,050,000	(3,131,250)	918,750
Total intangible assets	11	<u>24,717,873</u>	<u>(21,024,022)</u>	<u>3,693,851</u>	<u>24,717,873</u>	<u>(19,957,728)</u>	<u>4,760,145</u>
Total goodwill and intangible assets		<u>\$ 35,231,244</u>	<u>\$ (21,024,022)</u>	<u>\$ 14,207,222</u>	<u>\$ 35,231,244</u>	<u>\$ (19,957,728)</u>	<u>\$ 15,273,516</u>

(a) Goodwill was recorded from the Inovio AS acquisition in January 2005, the acquisition of VGX in June 2009 and the acquisition of Bioject in April 2016 for \$3.9 million, \$6.2 million and \$400,000, respectively.

(b) CELLECTRA® and GHRH are developed technologies which were recorded from the acquisition of VGX.

(c) Bioject intangible assets represent the estimated fair value of developed technology and intellectual property which were recorded from the Bioject asset acquisition.

(d) Other intangible assets represent the estimated fair value of acquired intellectual property from the Inovio AS acquisition.

Aggregate amortization expense on intangible assets was \$1.1 million, \$1.2 million and \$1.6 million for the years ended December 31, 2019, 2018 and 2017, respectively. Amortization expense related to intangible assets at December 31, 2019 is expected to be incurred as follows:

Year ending December 31,	
2020	\$ 547,081
2021	520,414
2022	492,818
2023	275,760
2024	253,333
Thereafter	1,604,445
	<u>\$ 3,693,851</u>

There were no impairment or impairment indicators present and no losses were recorded during the years ended December 31, 2019, 2018 and 2017, respectively.

10. Convertible Debt

Convertible Senior Notes

On February 19, 2019 and March 1, 2019, the Company completed a private placement of \$78.5 million aggregate principal amount of its 6.50% convertible senior notes due 2024 (the “Notes”). The Notes were sold in a private offering to qualified institutional buyers pursuant to Rule 144A under the Securities Act of 1933, as amended. Net proceeds from the offering were approximately \$75.7 million.

The Notes are senior unsecured obligations of the Company and accrue interest payable in cash semi-annually in arrears on March 1 and September 1 of each year, beginning on September 1, 2019, at a rate of 6.50% per annum. The Notes will mature on March 1, 2024, unless earlier converted, redeemed or repurchased. Prior to the close of business on the business day immediately preceding November 1, 2023, the Notes will be convertible at the option of the holders only upon the satisfaction of certain circumstances. Thereafter, the Notes will be convertible at the option of the holders at any time until the close of business on the scheduled trading day immediately before the maturity date. Upon conversion, the Company will pay or deliver, as the case may be, cash, shares of its common stock or a combination of cash and shares of its common stock, at its election. The initial conversion rate will be 185.8045 shares per \$1,000 principal amount of Notes (equivalent to an initial conversion price of approximately \$5.38 per share), subject to adjustment upon the occurrence of specified events.

The Company may not redeem the Notes prior to March 1, 2022. On or after March 1, 2022, the Company may redeem all, or any portion, of the Notes for cash if the last reported sale price per share of the Company's common stock exceeds 130% of the conversion price on (i) each of at least 20 trading days (whether or not consecutive) during the 30 consecutive trading days ending on, and including, the trading day immediately before the Company sends the related redemption notice; and (ii) the trading day immediately before the date the Company sends such redemption notice. The redemption price will be equal to 100% of the principal amount of the Notes to be redeemed, plus accrued and unpaid interest to, but excluding, the redemption date.

The Company evaluated the accounting for the issuance of the Notes and concluded that the embedded conversion features meet the requirements for a derivative scope exception for instruments that are both indexed to an entity's own stock and classified in stockholders' equity in its consolidated balance sheet, and that the cash conversion guidance applies. Therefore, the Notes issuance proceeds of \$78.5 million are allocated first to the liability component based on the fair value of non-convertible debt with otherwise identical residual terms with the residual proceeds allocated to equity for the conversion features. The Company determined that the fair value of the non-convertible debt upon issuance of the Notes was \$62.2 million and recorded this amount as a liability and the offsetting amount as a debt discount as a reduction to the carrying value of the Notes on the closing date. The debt issuance costs associated with the Notes of \$2.8 million are allocated to the liability and equity component in the same proportion as the issuance proceeds.

The Company determined that all other features of the Notes were clearly and closely associated with a debt host and did not require bifurcation as a derivative liability, or the fair value of the feature was immaterial to the Company's consolidated financial statements.

The balance of the Notes at December 31, 2019 is as follows:

Principal amount	\$	78,500,000
Unamortized debt discount on the liability component		(14,082,302)
Unamortized debt issuance cost		(1,938,206)
Accrued interest		1,700,833
Net carrying amount	\$	64,180,325

The Company determined that the expected life of the Notes was equal to the period through November 1, 2023 as this represents the point at which the Notes are initially subject to repurchase by the Company at the option of the holders. Accordingly, the total debt discount of \$18.6 million, inclusive of the fair value of the embedded conversion feature derivative at issuance, is being amortized using the effective interest method through November 1, 2023. The effective interest rate of the liability component is 13.1%. For the year ended December 31, 2019, the Company recognized \$7.0 million of interest expense related to the Notes, of which \$4.4 million related to the contractual interest coupon. As of December 31, 2019, there have not been any conversions or redemptions of the Notes.

August 2019 Convertible Bonds

On August 1, 2019, the Company closed a private placement of the August 2019 Bonds with an aggregate principal amount of 18 billion Korean Won (KRW) (approximately USD \$15.0 million based on the exchange rate on the date of issuance) issued to institutional investors led by Korea Investment Partners (KIP), a global venture capital and private equity firm based in Seoul, Korea. Net proceeds from the offering were approximately \$14.5 million. The Company also announced its intent to pursue a listing of its securities on the KOSDAQ Market of the Korea Exchange (KOSDAQ) in the form of Korean Depository Receipts (KDRs) representing shares of common stock.

The August 2019 Bonds, which are unsecured obligations of the Company, were issued on August 1, 2019 and will accrue interest at a coupon rate of 1.00% per annum, payable quarterly. The August 2019 Bonds will mature on July 31, 2024, unless earlier converted or repurchased. The outstanding August 2019 Bonds will be repaid at maturity at a price equal to the principal of the outstanding bonds to be repaid plus a premium on such bonds to provide an internal rate of return with respect to such bonds of 6.00%. Commencing on August 1, 2020, the August 2019 Bonds will be convertible until the date that is one month prior to maturity date. Upon conversion, the Company will deliver KDRs, if the Company has any such securities listed on the KOSDAQ at that time, or otherwise shares of common stock, if KDRs are not listed on KOSDAQ at that time or the converting holder requests delivery of shares of common stock. The initial conversion rate is 211.0595 shares per KRW 1,000,000 in principal amount (equivalent to an initial conversion price of approximately USD \$4.00 per share based on the exchange rate as of July 30, 2019), subject to adjustment upon the occurrence of specified events. The conversion rate is subject to reset on January 2, 2020 and on each three month anniversary thereafter until the maturity date to the then current market price if the current market price is lower than the conversion price then in effect; provided that the conversion rate will not exceed 351.7658 shares per KRW 1,000,000 (equivalent to a conversion price of approximately USD \$2.40 per share based on the exchange rates as of July 30, 2019).

The August 2019 Bonds will be subject to repurchase by the Company at the option of the bondholders from and including July 31, 2022 up to the date that is one month prior to the maturity date at a repurchase price equal to the principal of the August 2019 Bonds to be repurchased plus a premium in order to provide an internal rate of return with respect to the August 2019 Bonds of 6.00%. In addition, upon the occurrence of a fundamental change (as defined in the August 2019 Bonds), the Company will be required to offer to repurchase the August 2019 Bonds at a repurchase price equal to the principal amount thereof plus accrued and unpaid interest thereon but excluding the applicable repurchase date. Upon the occurrence of an event of default (as defined in the August 2019 Bonds), with the approval of at least 25% of the bondholders, the Company will be required to offer to repurchase the August 2019 Bonds at a repurchase price equal to the principal amount thereof plus a premium in order to provide an internal rate of return with respect to the August 2019 Bonds of 8.00%.

The Company evaluated the accounting for the issuance of the August 2019 Bonds and concluded that the embedded conversion feature is considered a derivative requiring bifurcation from the August 2019 Bonds as it does not meet the equity scope exception due to the fact that it is denominated in a currency other than the Company's functional currency. The fair value of the conversion feature at August 1, 2019 was \$7.1 million, which was recorded as a reduction to the carrying value of the debt. This debt discount is being amortized to interest expense over the term of the debt using the effective interest method. The conversion option is accounted for as a derivative liability, which is revalued each reporting period with the resulting change in fair value reflected in other income (expense), net, in the consolidated statements of operations.

The Company determined that all other features of the August 2019 Bonds were clearly and closely associated with a debt host and did not require bifurcation as a derivative liability, or the fair value of the feature was immaterial to the Company's consolidated financial statements.

The balance of the August 2019 Bonds at December 31, 2019 is as follows:

Principal amount	\$	15,578,211
Unamortized debt discount		(6,764,346)
Unamortized debt issuance cost		(255,185)
Accretion of premium associated with the August 2019 Bonds		227,322
Accrued interest		38,946
Net carrying amount	\$	8,824,948

The Company determined that the expected life of the August 2019 Bonds was equal to the period through August 1, 2022 as this represents the point at which the August 2019 Bonds are initially subject to repurchase by the Company at the option of the holders. Accordingly, the total debt discount of \$7.3 million, inclusive of the fair value of the embedded conversion feature derivative at issuance, is being amortized using the effective interest method through August 1, 2022. The effective interest rate of the August 2019 Bonds is 29.4%. For the year ended December 31, 2019, the Company recognized \$982,000 of interest expense related to the August 2019 Bonds, of which \$65,000 related to the contractual interest coupon. As of December 31, 2019, there have not been any conversions or redemptions of the August 2019 Bonds.

The derivative liability is valued at \$8.8 million as of December 31, 2019. The change in fair value of the derivative liability was \$1.8 million for the year ended December 31, 2019.

December 2019 Convertible Bonds

On December 26, 2019, the Company closed a private placement of convertible promissory notes (the "December 2019 Bonds") with an aggregate principal amount of 4.7 billion KRW (approximately USD \$4.1 million based on the exchange rate on the date of issuance) issued to a Korea-based institutional investor. Net proceeds from the offering were approximately \$4.0 million.

The December 2019 Bonds, which are unsecured obligations of the Company, were issued on December 31, 2019 and will accrue interest at a coupon rate of 1.00% per annum, payable quarterly. The December 2019 Bonds will mature on December 31, 2024, unless earlier converted or repurchased. The outstanding December 2019 Bonds will be repaid at maturity at a price equal to the principal of the outstanding bonds to be repaid plus a premium on such bonds to provide an internal rate of return with respect to such bonds of 6.00%. Commencing on December 31, 2020, the December 2019 Bonds will be convertible until the date that is one month prior to maturity date. Upon conversion, the Company will deliver KDRs, if the Company has any such securities listed on the KOSDAQ at that time, or otherwise shares of common stock of the Company. The initial conversion rate will be 214.7766 shares per KRW1,000,000 principal amount of Bonds (equivalent to an initial conversion price of approximately USD \$4.00 per share based on the exchange rate as of December 19, 2019), subject to adjustment upon the occurrence of certain events. The conversion rate is subject to reset on July 2, 2020 and on each three month anniversary thereafter until the maturity date to the then current market price if the current market price is lower than the conversion price then in effect; provided that the conversion rate will not exceed 357.9611 shares per KRW1,000,000 (equivalent to a conversion price of approximately USD \$2.40 per share based on the exchange rate as of December 19, 2019).

The December 2019 Bonds will be subject to repurchase by the Company at the option of the bondholders from and including December 31, 2022 up to the date that is one month prior to the maturity date at a repurchase price equal to the principal of the December 2019 Bonds to be repurchased plus a premium on the Bonds in order to ensure an internal rate of return with respect to the Bonds equal to 6.00%. In addition, upon the occurrence of a fundamental change (as defined in the Subscription Agreement) the Company will be required to offer to repurchase the Bonds at a repurchase price equal to the principal amount thereof plus accrued and unpaid interest thereon to but excluding the applicable repurchase date. If certain bankruptcy and insolvency-related events of default occur, the principal of, and accrued and unpaid interest on, all of the then outstanding December 2019 Bonds shall automatically become due and payable. If any other event of default occurs and is continuing, the holders of at least 25% of the in aggregate principal amount of the December 2019 Bonds by notice to the Company may declare the principal of, and accrued and unpaid interest on, all of the then-outstanding December 2019 Bonds to be due and payable.

The Company evaluated the accounting for the issuance of the December 2019 Bonds and concluded that the embedded conversion feature does not require bifurcation from the December 2019 Bonds. Although the embedded conversion feature

meets the definition of a derivative, it qualifies for the equity scope exception for instruments that are both indexed to an entity's own stock and classified in stockholders' equity in its consolidated balance sheet. The December 2019 Bonds are denominated in a foreign currency other than the Company's functional currency, which would typically violate the settlement provision criteria when analyzing whether the conversion option is indexed to an entity's own stock. However, per the terms of the agreement, the functional currency rate required to be used in a conversion scenario is fixed as of the date preceding the date of issuance of the Bonds. Therefore, the fluctuation in functional currency doesn't impact the settlement of the conversion option. Further, as there is no cash conversion feature or beneficial conversion feature on the date of issuance, and the Bonds were not issued at a substantial premium, all of the proceeds were recorded as a liability.

The Company determined that all other features of the December 2019 Bonds were clearly and closely associated with a debt host and did not require bifurcation as a derivative liability, or the fair value of the feature was immaterial to the Company's consolidated financial statements.

The balance of the December 2019 Bonds at December 31, 2019 is as follows:

Principal amount	\$	4,067,644
Unamortized debt issuance cost		(50,000)
Accretion of premium associated with the December 2019 Bonds		—
Accrued interest		—
Net carrying amount	\$	4,017,644

The Company determined that the expected life of the December 2019 Bonds was equal to the period through December 31, 2022 as this represents the point at which the December 2019 Bonds are initially subject to repurchase by the Company at the option of the holders. The effective interest rate of the December 2019 Bonds is 6.2%. For the year ended December 31, 2019, the Company recognized no interest expense related to the December 2019 Bonds. As of December 31, 2019, there have not been any conversions or redemptions of the December 2019 Bonds.

As of December 31, 2019, future minimum payments due under the Company's convertible debt instruments are as follows:

Year ending December 31,	Convertible Notes (1)	August 2019 Bonds (2)	December 2019 Bonds (2)	Total
2020	\$ 5,103,000	\$ 156,000	\$ 31,000	\$ 5,290,000
2021	5,103,000	156,000	41,000	5,300,000
2022	5,103,000	156,000	41,000	5,300,000
2023	5,103,000	156,000	41,000	5,300,000
2024	81,051,000	20,021,000	5,236,000	106,308,000
Total	\$ 101,463,000	\$ 20,645,000	\$ 5,390,000	\$ 127,498,000

(1) Amounts represent contractual amounts due under the Notes, including interest based on the fixed rate of 6.5% per year.

(2) Amounts represent contractual amounts due under the August 2019 and December 2019 Bonds, including interest based on the fixed rate of 1% per year plus a premium on such bonds to provide an internal rate of return with respect to such Bonds of 6% at maturity.

11. Accounts Payable and Accrued Expenses

Accounts payable and accrued expenses at December 31, 2019 and 2018 consist of the following:

	As of December 31,	
	2019	2018
Trade accounts payable	\$ 6,919,081	\$ 10,043,816
Accrued compensation	8,967,897	9,466,821
Accrued subcontract costs	273,508	83,812
Other accrued expenses	2,076,772	3,540,284
	\$ 18,237,258	\$ 23,134,733

12. Stockholders' Equity

Preferred Stock

	Shares Authorized	Shares Issued	Shares Outstanding as of December 31,	
			2019	2018
Series C Preferred Stock, par \$0.001	1,091	1,091	23	23

The shares of the Company's Series C Preferred Stock have the following pertinent rights and privileges, as set forth in the Company's Amended and Restated Certificate of Incorporation and its Certificates of Designations, Rights and Preferences related to the various series of preferred stock.

Rights on Liquidation

In the event of any voluntary or involuntary liquidation, dissolution or winding up of the Company (a "liquidation event"), before any distribution of assets of the Company shall be made to or set apart for the holders of common stock, the holders of Series C Preferred Stock, *pari passu*, are entitled to receive payment of such assets of the Company in an amount equal to \$10,000 per share of such series of preferred stock, plus any accumulated and unpaid dividends thereon (whether or not earned or declared).

If the assets of the Company available for distribution to stockholders exceed the aggregate amount of the liquidation preferences payable with respect to all shares of each series of preferred stock then outstanding, then, after the payment of such preferences is made or irrevocably set aside, the holders of the Company's common stock are entitled to receive a pro rata portion of such assets based on the aggregate number of shares of common stock held by each such holder. The holders of the Company's outstanding preferred stock shall participate in such a distribution on a pro-rata basis, computed based on the number of shares of common stock which would be held by such preferred holders if immediately prior to the liquidation event all of the outstanding shares of the preferred stock had been converted into shares of common stock at the then current conversion value applicable to each series.

A Change of Control of the Company (as defined in the Certificates of Designations, Rights and Preferences) is not a liquidation event triggering the preferences described above, and is instead addressed by separate terms in the Series C Certificates of Designations, Rights, and Preferences.

Although the liquidation preferences are in excess of the par value of \$0.001 per share of the Company's preferred stock, these preferences are equal to or less than the stated value of such shares based on their original purchase price.

Voting Rights

The holders of Series C Preferred Stock have full voting rights and powers equal to the voting rights and powers of holders of the Company's common stock and are entitled to notice of any stockholders' meeting in accordance with the Company's Bylaws. Holders are entitled to vote on any matter upon which holders of the Company's common stock have the right to vote, including, without limitation, the right to vote for the election of directors together with the holders of common stock as one class. Series C Preferred holders are entitled to 368 votes for each share of Series C Preferred Stock held.

Holder Optional Conversion Right

The holder of any share or shares of Series C Preferred Stock has the right at any time, at such holder's option, to convert all or any lesser portion of such holder's shares of the Preferred Stock into such number of fully paid and non-assessable shares of Common Stock as is determined by dividing (i) the aggregate Liquidation Preference applicable to the particular series of preferred shares, plus accrued and unpaid dividends thereon by (ii) the applicable Conversion Value (as defined in the relevant series' Certificate of Designations, Rights and Preferences) then in effect for such series of preferred shares. As of December 31, 2019, the Conversion Value was \$27.20, such that the outstanding shares of Series C Preferred Stock were convertible into 8,456 shares of common stock. The Company is not obligated to issue any fractional shares or scrip representing fractional shares upon such conversion and instead shall pay the holder an amount in cash equal to such fraction multiplied by the current market price per share of the Company's common stock.

Company Mandatory Conversion Option

The Company has the option upon thirty (30) days prior written notice, to convert all of the outstanding shares of the Series C Preferred Stock into such number of fully paid and non-assessable shares of common stock as is determined by dividing (i) the aggregate Liquidation Preference of the shares of the relevant series of preferred stock to be converted, plus accrued and unpaid dividends thereon by (ii) the applicable Conversion Value (as defined in the relevant series' Certificate of Designations, Rights and Preferences) then in effect, if the following triggering events have occurred:

(i) the price of the Company's common stock exceeds \$72.00 per share for 20 out of 30 consecutive trading days; and

(ii) the average daily trading volume (subject to adjustment for stock dividends, subdivisions and combinations) of the common stock exceeds 6,250 shares for at least 20 out of 30 consecutive trading days.

Common Stock

In May 2018, the Company entered into the Sales Agreement with Stifel, Nicolaus and Company (the "Placement Agent") to sell shares of its common stock with aggregate gross proceeds of up to \$100.0 million, from time to time, through an "at-the-market" equity offering program under which the Placement Agent will act as sales agent. Under the Sales Agreement, the Company will set the parameters for the sale of shares, including the number of shares to be issued, the time period during which sales are requested to be made, limitation on the number of shares that may be sold in any one trading day and any minimum price below which sales may not be made. The Sales Agreement provides that the Placement Agent will be entitled to compensation for its services in an amount equal to up to 3.0% of the gross proceeds from the sales of shares sold through the Placement Agent under the Sales Agreement. The Company has no obligation to sell any shares under the Sales Agreement, and may at any time suspend solicitation and offers under the Sales Agreement.

During the year ended December 31, 2019, the Company sold a total of 3,340,678 shares of common stock under the Sales Agreement. The sales were made at a weighted average price of \$2.78 per share resulting in aggregate net proceeds of \$9.1 million. As of December 31, 2019, the Company may sell up to an additional \$62.8 million in shares of its common stock under the Sales Agreement. The registration statement that registered with the SEC the shares that may be sold under the Sales Agreement expires on June 8, 2021.

As described in Note 19 below, subsequent to December 31, 2019, the Company and the Placement Agent entered into a first and second amendment to the Sales Agreement to increase the amount of common stock that may be sold under the Sales Agreement from \$100.0 million to \$250.0 million. The Company also sold shares of common stock under the Sales Agreement subsequent to December 31, 2019.

In June 2016, the Company entered into an At-the-Market Equity Offering Sales Agreement (the "Prior Sales Agreement") with the same placement agent. The registration statement that registered with the SEC the shares sold under the Prior Sales Agreement expired on June 5, 2018, and no further sales can be made under the Prior Sales Agreement. The Company sold an aggregate of 3,911,104 shares of common stock under the Prior Sales Agreement resulting in aggregate net proceeds of \$32.1 million. During the period from January 1, 2018 to June 5, 2018, the Company sold a total of 314,950 shares of common stock under the Prior Sales Agreement. The sales were made at a weighted average price of \$5.07 per share resulting in aggregate net proceeds of \$1.6 million. During the year ended December 31, 2017, the Company sold a total of 2,937,406 shares of common stock under the Prior Sales Agreement. The sales were made at a weighted average price of \$8.41 per share resulting in aggregate net proceeds of \$24.2 million.

Warrants

During the year ended December 31, 2018, warrants to purchase 284,091 shares of the Company's common stock were exercised, with net proceeds to the Company of \$902,000. As of December 31, 2019 and 2018, there were no common stock warrants outstanding.

Stock Options and Restricted Stock Units

The Company has a stock-based incentive plan, the 2016 Omnibus Incentive Plan (as amended to date, the "2016 Incentive Plan"), pursuant to which the Company may grant stock options, restricted stock awards, restricted stock units and other stock-based awards or short-term cash incentive awards to employees, directors and consultants.

The 2016 Incentive Plan was originally approved by the Company's stockholders on May 13, 2016, and an amendment to the plan to increase the number of shares available for issuance was approved by the stockholders on May 8, 2019. The maximum number of shares of the Company's common stock available for issuance over the term of the 2016 Incentive Plan may not exceed 16,000,000 shares, provided that commencing with the first business day of each calendar year beginning January 1, 2020, such maximum number of shares shall be increased by 2,000,000 shares of common stock unless the Board determines, prior to January 1 for any such calendar year, to increase such maximum amount by a fewer number of shares or not to increase the maximum amount at all for such year. On January 1, 2020, the maximum number of shares to be issued was increased by 2,000,000. At December 31, 2019, there were 16,000,000 shares of common stock reserved for issuance upon exercise of incentive awards granted and to be granted at future dates under the 2016 Incentive Plan. At December 31, 2019, the Company had 8,214,032 shares of common stock available for future grant under the 2016 Incentive Plan, 2,069,936 shares underlying outstanding but unvested restricted stock units and options outstanding to purchase 4,497,736 shares of common stock under the 2016 Incentive Plan. The awards granted and available for future grant under the 2016 Incentive Plan generally vest over three years and have a maximum contractual term of ten years. The 2016 Incentive Plan terminates by its terms on March 9, 2026.

The Amended and Restated 2007 Omnibus Incentive Plan (the "2007 Incentive Plan") was adopted on March 31, 2007 and terminated by its terms on March 31, 2017. At December 31, 2019, the Company had options outstanding to purchase 4,767,654 shares of common stock under the 2007 Incentive Plan. The awards granted under the 2007 Incentive Plan generally vest over three years and have a maximum contractual term of ten years.

Total employee and director stock-based compensation expense recognized in the consolidated statements of operations for the years ended December 31, 2019, 2018 and 2017 was \$9.8 million, \$10.2 million and \$12.9 million, respectively, of which \$5.9 million, \$5.9 million and \$5.8 million was included in research and development expenses and \$3.9 million, \$4.3 million and \$7.1 million was included in general and administrative expenses, respectively.

At December 31, 2019 and 2018, there was \$3.4 million and \$5.2 million, respectively, of total unrecognized compensation expense related to unvested stock options, which are each expected to be recognized over a weighted-average period of 1.7 years.

At December 31, 2019 and 2018, there was \$4.3 million and \$5.1 million, respectively, of total unrecognized compensation expense related to unvested restricted stock units, which is expected to be recognized over a weighted-average period of 1.6 years and 1.7 years, respectively.

The Company adopted ASU 2018-07 on January 1, 2019, which generally aligned the accounting for stock-based compensation for non-employees with that of employees. The fair value of stock options granted to non-employees was estimated using the Black-Scholes pricing model. Total stock-based compensation expense for stock options and restricted stock units granted to non-employees for the years ended December 31, 2019, 2018 and 2017 was \$970,000, \$302,000 and \$201,000, respectively. As of December 31, 2019, options to purchase 952,500 shares of common stock granted to non-employees remained outstanding.

The following table summarizes total stock options outstanding at December 31, 2019:

Exercise Price	Options Outstanding			Options Exercisable		
	Shares Underlying Options Outstanding	Weighted-Average Remaining Contractual Life (in Years)	Weighted Average Exercise Price	Shares Underlying Options Exercisable	Weighted Average Exercise Price	
\$1.48-\$3.00	903,257	3.4	\$ 2.29	848,969	\$	2.26
\$3.01-\$6.00	4,066,998	7.9	\$ 3.90	1,844,977	\$	4.12
\$6.01-\$9.00	3,454,212	6.1	\$ 7.20	3,210,448	\$	7.24
\$9.01-\$12.00	220,880	5.8	\$ 9.83	220,880	\$	9.83
\$12.01-\$15.00	620,043	4.2	\$ 12.96	620,043	\$	12.96
	<u>9,265,390</u>	6.5	\$ 5.72	<u>6,745,317</u>	\$	6.37

At December 31, 2019, the aggregate intrinsic value of options outstanding was \$918,000, the aggregate intrinsic value of options exercisable was \$881,000, and the weighted average remaining contractual term of options exercisable was 5.7 years.

At December 31, 2019, the aggregate intrinsic value of unvested restricted stock units was \$6.8 million and the aggregate intrinsic value of restricted stock units which vested during the year ended December 31, 2019 was \$3.5 million.

At December 31, 2019, options to purchase 9,265,390 shares of common stock and 2,069,936 restricted stock units were expected to vest.

Stock option activity under the Company's equity incentive plans during the year ended December 31, 2019 was as follows:

	Number of Shares	Weighted-Average Exercise Price
Balance, December 31, 2018	8,752,677	\$ 6.35
Granted	2,596,468	3.39
Exercised	(42,969)	2.62
Cancelled	(2,040,786)	5.49
Balance, December 31, 2019	<u>9,265,390</u>	\$ 5.72

Restricted stock unit activity under the Company's equity incentive plans during the year ended December 31, 2019 was as follows:

	Number of Shares
Balance, December 31, 2018	1,688,017
Granted	1,491,771
Vested	(1,003,218)
Cancelled	(106,634)
Balance, December 31, 2019	<u>2,069,936</u>

The weighted average exercise price per share was \$6.27 for the 324,502 options which expired during the year ended December 31, 2019, \$5.17 for the 119,091 options which expired during the year ended December 31, 2018 and \$9.67 for the 200,501 options which expired during the year ended December 31, 2017.

The weighted average grant date fair value per share was \$2.19, \$2.86 and \$4.33 for options granted during the years ended December 31, 2019, 2018 and 2017, respectively.

The weighted average grant date fair value was \$3.09, \$4.31 and \$6.66 per share for restricted stock units granted during the years ended December 31, 2019, 2018 and 2017, respectively.

The Company received \$113,000, \$1.5 million and \$2.3 million in proceeds from the exercise of stock options during the years ended December 31, 2019, 2018 and 2017, respectively. The aggregate intrinsic value of options exercised was \$25,000, \$910,000 and \$519,000 during the years ended December 31, 2019, 2018 and 2017, respectively.

13. Leases

The Company leases approximately 82,200 square feet of office, laboratory, and manufacturing space in San Diego, California and 57,360 square feet of office space in Plymouth Meeting, Pennsylvania under various non-cancellable operating lease agreements with remaining lease terms of 3.9 to 9.9 years, which represent the non-cancellable periods of the leases. The Company has excluded the extension options from its lease terms in the calculation of future lease payments as they are not reasonably certain to be exercised. The Company's lease payments consist primarily of fixed rental payments for the right to use the underlying leased assets over the lease terms as well as payments for common area maintenance and administrative services. The Company has received customary incentives from its landlords, such as reimbursements for tenant improvements and rent abatement periods, which effectively reduce the total lease payments owed for these leases.

The Company has evaluated all of its leases and determined that, effective upon the adoption of Topic 842, they were all operating leases. The Company performed an evaluation of its other contracts with customers and suppliers in accordance with Topic 842 and determined that, except for the real estate leases described above and various copier leases, none of its other contracts contain a right-of-use asset.

Operating lease right-of-use assets and liabilities on the consolidated balance sheet represents the present value of the remaining lease payments over the remaining lease terms. Payments for additional monthly fees to cover the Company's share of certain facility expenses are not included in operating lease right-of-use assets and liabilities. The Company uses its incremental borrowing rate to calculate the present value of its lease payments, as the implicit rates in the leases are not readily determinable.

As of December 31, 2019, the maturities of the Company's operating lease liabilities were as follows:

<u>Year ending December 31,</u>	
2020	\$ 3,891,000
2021	3,979,000
2022	4,052,000
2023	4,023,000
2024	3,001,000
Thereafter	12,951,000
Total remaining lease payments	31,897,000
Less: present value adjustment	(9,412,236)
Total operating lease liabilities	22,484,764
Less: current portion	(2,074,842)
Long-term operating lease liabilities	\$ 20,409,922
Weighted-average remaining lease term	8.2 years
Weighted-average discount rate	8.4%

Lease costs included in operating expenses in the consolidated statements of operations for the years ended December 31, 2019, 2018 and 2017 were \$3.2 million, \$3.4 million and \$2.5 million, respectively. Operating lease costs consisting of the fixed lease payments included in operating lease liabilities are recorded on a straight-line basis over the lease terms. Variable lease costs are recorded as incurred.

In the fourth quarter of 2019, the Company entered into two agreements to sublease a total of approximately 13,500 square feet in its Plymouth Meeting headquarters through periods between December 31, 2022 and March 31, 2025.

As of December 31, 2018, prior to the adoption of Topic 842, annual future minimum lease payments under non-cancelable operating leases were as follows:

<u>Year ending December 31,</u>	
2019	\$ 3,756,000
2020	3,891,000
2021	3,979,000
2022	4,052,000
2023	4,023,000
Thereafter	15,952,000
Total	\$ 35,653,000

In the normal course of business, the Company is a party to a variety of agreements pursuant to which it may be obligated to indemnify the other party. It is not possible to predict the maximum potential amount of future payments under these types of agreements due to the conditional nature of the Company's obligations and the unique facts and circumstances involved in each particular agreement. Historically, payments made by the Company under these types of agreements have not had a material effect on its business, consolidated results of operations or financial condition.

14. Investments in Affiliated Entities

The Company held 1,644,155 common shares, representing a 7.5% and 7.8% ownership interest in GeneOne as of December 31, 2019 and 2018, respectively, and 395,758 common shares, representing a 15.0% and 15.1% ownership interest in PLS as of December 31, 2019 and 2018, respectively. Please see further information as discussed in Note 2 and Note 6.

15. Income Taxes

In accordance with the guidance pursuant to accounting for income taxes, a deferred tax asset or liability is determined based on the difference between the financial statement and tax basis of assets and liabilities as measured by the enacted tax rates which will be in effect when these differences reverse. The Company provides a valuation allowance against net deferred tax assets unless, based upon the available evidence, it is more likely than not that the deferred tax asset will be realized.

The components of the provision for income taxes are presented in the following table:

	Year Ended December 31,		
	2019	2018	2017
Current:			
Federal	\$ 4,000	\$ —	\$ —
State	2,000	—	—
Foreign	—	2,170,000	—
	<u>6,000</u>	<u>2,170,000</u>	<u>—</u>
Deferred:			
Federal	(263,000)	—	—
State	—	—	—
Foreign	—	—	—
	<u>(263,000)</u>	<u>—</u>	<u>—</u>
	<u>\$ (257,000)</u>	<u>\$ 2,170,000</u>	<u>\$ —</u>

The reconciliation of income taxes attributable to continuing operations computed at the statutory tax rates to income tax expense (benefit), using a 21% statutory tax rate for December 31, 2019 and 2018, and 35% statutory tax rate for December 31, 2017, is as follows:

	Year Ended December 31,		
	2019	2018	2017
Income (benefit) taxes at statutory rates	\$ (25,370,000)	\$ (19,908,000)	\$ (30,872,000)
State income tax, net of federal benefit	—	(4,000)	(4,000)
Foreign income taxes	—	2,170,000	—
Change in valuation allowance	25,457,000	20,898,000	(20,965,000)
Research and development tax credits	(3,838,000)	(3,170,000)	(3,456,000)
Change in fair value of warrants	—	(76,000)	(282,000)
Stock-based compensation	1,114,000	1,094,000	2,332,000
Uncertain tax positions	1,537,000	1,268,000	846,000
Expired NOLs and credits	616,000	2,176,000	454,000
Limited NOLs and credits	(616,000)	(2,176,000)	(165,000)
Change in tax rates	12,000	—	50,019,000
Other	831,000	(102,000)	2,093,000
	<u>\$ (257,000)</u>	<u>\$ 2,170,000</u>	<u>\$ —</u>

The income tax benefit recorded during the year ended December 31, 2019 of \$0.3 million is principally due to a requirement under Accounting Standards Codification ("ASC") 740, *Accounting for Income Taxes*, that a company must consider all sources of income in order to determine the tax benefit resulting from a loss from continuing operations. As a result of the requirement under ASC 740-20-45-7, the pretax income which the Company generated from other comprehensive income was a source of income which resulted in the partial realization of the current year loss from continuing operations.

Significant components of the Company's deferred tax assets and liabilities as of December 31, 2019 and 2018 are shown below:

	As of December 31,	
	2019	2018
Deferred tax assets:		
Capitalized research expense	\$ 6,300,000	\$ 7,408,000
NOL carryforwards	110,788,000	89,399,000
Research and development and other tax credits	11,737,000	9,432,000
Deferred revenue	1,506,000	985,000
Deferred rent	—	2,013,000
Stock-based compensation	3,255,000	3,408,000
Acquired intangibles	889,000	912,000
Derivative liability	1,852,000	—
Interest expense	1,122,000	—
Investment in affiliated entity	645,000	—
Lease liability	4,722,000	—
Other	2,413,000	2,693,000
	145,229,000	116,250,000
Valuation allowance	(137,159,000)	(115,007,000)
Total deferred tax assets	8,070,000	1,243,000
Deferred tax liabilities:		
Acquired intangibles	(160,000)	(142,000)
Investment in affiliated entity	—	(4,000)
Right of use asset	(2,894,000)	—
Note discount	(2,862,000)	—
Convertible note	(1,381,000)	—
Fixed assets	(805,000)	(1,121,000)
Net deferred tax liabilities	\$ (32,000)	\$ (24,000)

As of December 31, 2019, the Company had federal, California and Pennsylvania tax net operating loss (NOL) carryforwards of \$483.3 million, \$68.6 million and \$80.5 million, respectively, net of the net operating losses that will expire due to IRC Section 382 limitations. The federal net operating loss generated in 2018 and 2019 of \$186.6 million will carryforward indefinitely and be available to offset up to 80% of future taxable income each year. The federal NOL carryforward began to expire in 2020, and the California and Pennsylvania NOL carryforwards will begin to expire in 2028 and 2021, respectively, unless previously utilized.

In addition, as of December 31, 2019, the Company had federal and state research and development (R&D) tax credit carryforwards of \$17.3 million and \$3.2 million, respectively. The federal tax credit carryforwards will begin to expire in 2029. The California research tax credits do not expire.

Based upon statute, federal and state losses and credits are expected to expire as follows (in millions):

Expiration Date:	Federal NOLs	State NOLs	Federal R&D	State R&D
2020	\$ 1.6	\$ —	\$ —	\$ —
2021	2.3	0.3	—	—
2022	6.0	0.3	—	—
2023	4.5	0.4	—	—
2024 and thereafter	282.3	148.1	17.3	—
Indefinite	186.6	—	—	3.2
	\$ 483.3	\$ 149.1	\$ 17.3	\$ 3.2

Pursuant to Internal Revenue Code (IRC) Sections 382 and 383, annual use of the Company's NOL and R&D credit carryforwards may be limited in the event that a cumulative change in ownership of more than 50% occurs within a three-year period. The Company has completed an IRC Section 382/383 analysis, regarding the limitation of NOL and R&D credit carryforwards as of December 31, 2019. As a result of the analysis, the Company estimates that approximately \$10.6 million of tax benefits related to NOL and R&D carryforwards will expire unused. Accordingly, the related NOL and R&D credit carryforwards have been removed from deferred tax assets, accompanied by a corresponding reduction of the valuation allowance. Due to the existence of the valuation allowance, limitations created by current and future ownership changes, if any, related to the Company's operations in the United States will not impact its effective tax rate. Any additional ownership changes may further limit the ability to use the NOL and R&D carryforwards.

The following table summarizes the activity related to the Company's unrecognized tax benefits:

	Year ended December 31,		
	2019	2018	2017
Balance at beginning of the year	\$ 9,632,000	\$ 8,313,000	\$ 6,855,000
Increases related to current year tax positions	1,575,000	1,319,000	1,532,000
Increases (decreases) related to prior year tax positions	(3,000)	—	(74,000)
Balance at end of the year	<u>\$ 11,204,000</u>	<u>\$ 9,632,000</u>	<u>\$ 8,313,000</u>

The amount of unrecognized tax benefits that, if recognized and realized, would affect the effective tax rate was \$9.9 million, \$8.3 million and \$7.1 million as of December 31, 2019, 2018 and 2017, respectively, subject to valuation allowances. The Company has not recorded any interest and penalties on the unrecognized tax positions as the Company has continued to generate net operating losses after accounting for the unrecognized tax benefits. The Company does not anticipate that the total amount of unrecognized tax benefits will significantly increase or decrease within twelve months of the reporting date.

The Company and its subsidiaries are subject to U.S. federal income tax as well as income tax in multiple state jurisdictions. With few exceptions, the Company is no longer subject to United States federal income tax examinations for years before 2016 and state and local income tax examinations before 2015. However, to the extent allowed by law, the tax authorities may have the right to examine prior periods where net operating losses were generated and carried forward, and make adjustments up to the amount of the NOL carryforward amount. The Company is not currently under Internal Revenue Service ("IRS"), state or local tax examination.

16. 401(k) Plan

The Company has adopted a 401(k) Profit Sharing Plan covering substantially all of its employees. The defined contribution plan allows the employees to contribute a percentage of their compensation each year. The Company currently matches 50% of its employees' contributions, up to 6% of their annual compensation. The Company's contributions are recorded as expense in the accompanying consolidated statements of operations and totaled \$1.2 million, \$1.2 million and \$822,000 for the years ended December 31, 2019, 2018 and 2017, respectively.

17. Related Party Transactions

GeneOne Life Sciences

The Company owned 1,644,155 shares of common stock in GeneOne as of December 31, 2019 and one of the Company's directors, Dr. David B. Weiner, acts as a consultant to GeneOne.

In 2010, the Company entered into a collaboration and license agreement (the "GeneOne Agreement") with GeneOne. Under the GeneOne Agreement, the Company granted GeneOne an exclusive license to the Company's SynCon® universal influenza vaccine delivered with electroporation to be developed in certain countries in Asia (the "Product"). As consideration for the license granted to GeneOne, the Company received an upfront payment of \$3.0 million, and is entitled to receive research support, annual license maintenance fees and royalties on net Product sales. The GeneOne Agreement also provides the Company with exclusive rights to supply devices for clinical and commercial purposes (including single use components) to GeneOne for use in the Product. The term of the GeneOne Agreement commenced upon execution and will extend on a country by country basis until the last to expire of all Royalty Periods for the territory (as such term is defined in the GeneOne Agreement) for any Product in that country, unless the GeneOne Agreement is terminated earlier in accordance with its provisions as a result of breach, by mutual agreement, or by GeneOne's right to terminate without cause upon prior written notice.

In 2011, the Company entered into a collaborative development and license agreement (the "Hep Agreement") with GeneOne. Under the Hep Agreement, as originally executed, the Company and GeneOne agreed to co-develop the Company's

SynCon® therapeutic vaccines for hepatitis B and C infections (the “Hep Products”). Under the terms of the Hep Agreement, GeneOne will receive marketing rights for the Products in Asia, excluding Japan, and in return will fully fund IND-enabling and initial Phase 1 and 2 clinical studies with respect to the Hep Products. The Company will receive from GeneOne payments based on the achievement of clinical milestones and royalties based on sales of the Hep Products in the licensed territories, retaining all commercial rights to the Hep Products in all other territories. In 2013, the Company amended the Hep Agreement to grant back to the Company the SynCon® therapeutic vaccines targeting hepatitis B, along with all associated rights, from the collaboration in return for certain remuneration including a percentage of license fees. In 2013, the Company further amended the Hep Agreement to in part provide exclusive patent rights to IL-28 technology for use with the Hep Products in Asia, excluding Japan. The Hep Agreement shall terminate upon the later of the expiration or abandonment of the last patent that is a component of the rights or 20 years after the effective date.

In May 2015, the Company entered into a Collaborative Development Agreement with GeneOne to co-develop a DNA vaccine for MERS through Phase 1 clinical trials. Under the terms of the agreement, GeneOne will be responsible for funding all preclinical and clinical studies through Phase 1. In return, GeneOne will receive up to a 35% milestone-based ownership interest in the MERS immunotherapy asset upon achievement of the last milestone event of completion of the Phase 1 safety and immunogenicity study. The collaborative research program shall terminate upon the completion of activities under the development plan, unless sooner terminated.

In January 2016, the Company and GeneOne amended the Collaborative Development Agreement for MERS to expand the agreement to test and advance the Company's DNA-based vaccine for preventing and treating Zika virus. GeneOne will be responsible for funding all preclinical and clinical studies through Phase 1. In return, GeneOne will receive up to a 35% milestone-based ownership interest in the Zika immunotherapy asset upon achievement of the last milestone event of the completion of the Phase 1 safety and immunogenicity study. All other agreement terms remain the same.

In December 2017, the Company completed the sale of certain assets related to its compound VGX-1027 to GeneOne for a purchase price of \$1.0 million.

Revenue recognized from GeneOne for the years ended December 31, 2019, 2018 and 2017 consisting of patent, device maintenance and licensing fees was \$127,000, \$342,000 and \$551,000, respectively.

Operating expenses recorded from transactions with GeneOne relate primarily to biologics manufacturing and were \$2.5 million, \$7.0 million and \$2.3 million for the years ended December 31, 2019, 2018 and 2017, respectively.

At December 31, 2019 and 2018, the Company had an accounts receivable balance of \$128,000 and \$0, respectively, and an accounts payable and accrued liability balance of \$511,000 and \$372,000, respectively, related to GeneOne and its subsidiaries. At December 31, 2019 and 2018, \$284,000 and \$381,000, respectively, of prepayments made to GeneOne were classified as long-term other assets on the consolidated balance sheets.

Plumblin Life Sciences, Inc.

The Company owned 395,758 shares of common stock in Plumblin Life Sciences, Inc. (“PLS”) as of December 31, 2019 and one of the Company's directors, Dr. David B. Weiner, acts as a consultant to PLS.

Revenue recognized from PLS consists of license fees. For the years ended December 31, 2019 and 2018, the Company recognized revenue from PLS of \$111,000 and \$107,000, respectively. At December 31, 2019 and 2018, the Company had an accounts receivable balance of \$589,000 and \$478,000, respectively, related to PLS.

The Wistar Institute

Two of the Company's directors as of December 31, 2019, Dr. David B. Weiner and Dr. Morton Collins, were directors of the Vaccine Center of The Wistar Institute (“Wistar”). Dr. Weiner is also the Executive Vice President of Wistar. Dr. Collins retired from the Company's Board of Directors effective January 14, 2020.

In March 2016, the Company entered into collaborative research agreements with Wistar for preventive and therapeutic DNA-based immunotherapy applications and products developed by Dr. Weiner and Wistar for the treatment of cancers and infectious diseases. Under the terms of the agreement, the Company will reimburse Wistar for all direct and indirect costs incurred in the conduct of the collaborative research, not to exceed \$3.1 million during the five-year term of the agreement. The Company will have the exclusive right to in-license new intellectual property developed in this agreement.

In November 2016, the Company received a \$6.1 million sub-grant through Wistar to develop a DNA-based monoclonal antibody against the Zika infection, with funding through July 2020.

The Company is also a collaborator with Wistar on an Integrated Preclinical/Clinical AIDS Vaccine Development grant from the NIAID, with funding through February 2020.

A grant funding liability recognized from Wistar and recorded as contra-research and development expense is related to work performed by the Company on the research sub-contract agreements. For the years ended December 31, 2019 and 2018, the Company recorded \$2.2 million and \$3.3 million, respectively, as contra-research and development expense from Wistar.

Research and development expenses recorded from Wistar relate primarily to the collaborative research agreements and sub-contract agreements related to the Bill and Melinda Gates Foundation and CEPI (see Note 4). Research and development expenses recorded from Wistar for the years ended December 31, 2019 and 2018 were \$1.5 million and \$1.8 million, respectively. At December 31, 2019 and 2018, the Company had an accounts receivable balance of \$616,000 and \$258,000, respectively, and an accounts payable and accrued liability balance of \$219,000 and \$554,000, respectively, related to Wistar. As of December 31, 2019, the Company had \$843,000 recorded as grant funding liability on its consolidated balance sheet related to Wistar.

18. Quarterly Financial Information (Unaudited)

The following is a summary of the quarterly results of operations of the Company for the years ended December 31, 2019 and 2018 (unaudited):

	Quarter Ended December 31, 2019	Quarter Ended September 30, 2019	Quarter Ended June 30, 2019	Quarter Ended March 31, 2019

19. Subsequent Events

On February 7, 2020, the Company entered into an amendment to the Sales Agreement, which amendment increased the amount of common stock that could be sold by the Company under the Sales Agreement from an aggregate offering price of up to \$100.0 million to an aggregate offering price of up to \$200.0 million. On March 9, 2020, the Company entered into a second amendment to the Sales Agreement, which amendment increased the amount of common stock that could be sold by the Company under the Sales Agreement from an aggregate offering price of up to \$200.0 million to an aggregate offering price of up to \$250.0 million. Under the Sales Agreement, as amended, the Company set the parameters for the sale of shares, including the number of shares to be issued, the time period during which sales were requested to be made, limitation on the number of shares that could be sold in any one trading day and any minimum price below which sales could not be made. The Sales Agreement provided that the Placement Agent is entitled to compensation for its services in an amount equal to up to 3.0% of the gross proceeds from the sales of shares sold through the Placement Agent under the Sales Agreement.

From January 1, 2020 through March 11, 2020, the Company sold 43,148,952 shares of common stock under its Sales Agreement for net proceeds of \$208.2 million. The sales were made at a weighted average price of \$4.92 per share. As of the date these financial statements were issued, there is no remaining capacity under the Sales Agreement, as amended.

On February 20, 2020, the Company entered into a Debt and Share Subscription Agreement with PLS under which the Company will receive shares of PLS common stock in exchange for a portion of the outstanding accounts receivable balance due from PLS. Following the issuance of these shares, the Company will hold a 19.9% ownership interest in PLS.

**DESCRIPTION OF THE REGISTRANT'S SECURITIES
REGISTERED PURSUANT TO SECTION 12 OF THE
SECURITIES EXCHANGE ACT OF 1934**

The following description summarizes selected information regarding our capital stock, as well as relevant provisions of: (i) our certificate of incorporation; (ii) our amended and restated bylaws; and (iii) the General Corporation Law of the State of Delaware, or the DGCL. The following summary is qualified in its entirety by, and should be read in conjunction with, the certificate of incorporation and the amended and restated bylaws, copies of which have been filed as exhibits to our Annual Report on Form 10-K to which this exhibit is a part, and the applicable provisions of the DGCL. All references to "we," "our," or "us" refer to Inovio Pharmaceuticals, Inc.

General

Our certificate of incorporation authorizes us to issue up to 600,000,000 shares of common stock, \$0.001 par value per share, and 10,000,000 shares of preferred stock, \$0.001 par value per share. Our board of directors may establish the rights and preferences of the preferred stock from time to time. As of December 31, 2019, 1,091 shares of preferred stock were designated Series C Cumulative Convertible Preferred Stock, of which 23 shares were outstanding.

Common Stock

The holders of our common stock are entitled to one vote for each share held of record on all matters submitted to a vote of stockholders and do not have any cumulative voting rights. Any election at a meeting of stockholders is determined by a plurality of the votes cast by the stockholders entitled to vote at the election, and all other matters are generally determined by a majority of the votes cast on the matter. Holders of our common stock are entitled to receive ratably such dividends, if any, as may be declared by our board of directors out of funds legally available. In the event of we liquidate, dissolve or wind up, after payment of all of our debts and liabilities, and subject to the preferential rights, if any, of any outstanding preferred stock, the holders of our common stock are entitled to share ratably in all assets. Our common stock has no preemptive or conversion rights or other subscription rights, and there are no redemptive or sinking funds provisions applicable to our common stock. The rights, preferences and privileges of the holders of common stock are subject to, and may be adversely affected by, the rights of the holders of shares of any series of preferred stock that we may designate in the future.

Preferred Stock

Pursuant to our certificate of incorporation, our board of directors has the authority, without further action by the stockholders (unless such stockholder action is required by applicable law or stock exchange listing rules), to designate and issue up to 10,000,000 shares of preferred stock in one or more series, to establish from time to time the number of shares to be included in each such series, to fix the designations, powers, preferences, privileges and relative participating, optional or special rights and the qualifications, limitations or restrictions thereof, including dividend rights, conversion rights, voting rights, terms of redemption and liquidation preferences, any or all of which may be greater than the rights of the common stock, and to increase or decrease the number of shares of any such series, but not below the number of shares of such series then outstanding.

Our board of directors, without stockholder approval, can issue preferred stock with voting, conversion or other rights that could adversely affect the voting power and other rights of the holders of common stock. Preferred stock could be issued quickly with terms designed to delay or prevent a change in control of our company or make removal of management more difficult. Additionally, the issuance of preferred stock may adversely affect the voting power of holders of common stock and reduce the likelihood that common stockholders will receive dividend payments and payments upon liquidation.

Our board of directors will fix the designations, voting powers, preferences and rights of each series, as well as the qualifications, limitations or restrictions thereof, of the preferred stock of each series.

Anti-Takeover Provisions

Section 203 of the DGCL

We are subject to Section 203 of the DGCL, which prohibits a Delaware corporation from engaging in any business combination with any interested stockholder for a period of three years after the date that such stockholder became an interested stockholder, with the following exceptions:

- before such date, the board of directors of the corporation approved either the business combination or the transaction that resulted in the stockholder becoming an interested stockholder;
- upon completion of the transaction that resulted in the stockholder becoming an interested stockholder, the interested stockholder owned at least 85% of the voting stock of the corporation outstanding at the time the transaction began, excluding for purposes of determining the voting stock outstanding, but not the outstanding voting stock owned by the interested stockholder, those shares owned (i) by persons who are directors and also officers and (ii) employee stock plans in which employee participants do not have the right to determine confidentially whether shares held subject to the plan will be tendered in a tender or exchange offer; or

- on or after such date, the business combination is approved by the board of directors and authorized at an annual or special meeting of the stockholders, and not by written consent, by the affirmative vote of at least 66 2/3% of the outstanding voting stock that is not owned by the interested stockholder.

In general, Section 203 defines a “business combination” to include the following:

- any merger or consolidation involving the corporation and the interested stockholder;
- any sale, transfer, pledge or other disposition of 10% or more of the assets of the corporation involving the interested stockholder;
- subject to certain exceptions, any transaction that results in the issuance or transfer by the corporation of any stock of the corporation to the interested stockholder;
- any transaction involving the corporation that has the effect of increasing the proportionate share of the stock or any class or series of the corporation beneficially owned by the interested stockholder; or
- the receipt by the interested stockholder of the benefit of any loans, advances, guarantees, pledges or other financial benefits by or through the corporation.

In general, Section 203 defines an “interested stockholder” as an entity or person who, together with the entity or person’s affiliates and associates, beneficially owns, or is an affiliate or associate of the corporation and within three years prior to the time of determination of interested stockholder status did own, 15% or more of the outstanding voting stock of the corporation.

Certificate of Incorporation and Bylaws

Our certificate of incorporation provides that our board of directors may issue shares of undesignated preferred stock and determine the rights, preferences and privileges of these shares, without stockholder approval and that all stockholder actions must be effected at a duly called meeting of stockholders and not by written consent. Our certificate of incorporation also does not provide for cumulative voting.

The authorization of undesignated preferred stock makes it possible for our board of directors to issue preferred stock with voting or other rights or preferences that could impede the success of any attempt to change our control. These provisions are intended to discourage coercive takeover practices and inadequate takeover bids. These provisions are also designed to reduce our vulnerability to hostile takeovers and to discourage certain tactics that may be used in proxy fights. However, such provisions could have the effect of discouraging others from making tender offers for our shares and may have the effect of delaying changes in our control or management. As a consequence, these provisions may also inhibit fluctuations in the market price of our stock that could result from actual or rumored takeover attempts. We believe that the benefits of these provisions, including increased protection of our potential ability to negotiate with the proponent of an unfriendly or unsolicited proposal to acquire or restructure our company, outweigh the disadvantages of discouraging takeover proposals, because negotiation of takeover proposals could result in an improvement of their terms.

Transfer Agent and Registrar

The transfer agent and registrar for our common stock is Computershare. The transfer agent’s address is 3rd Floor — 510 Burrard St., Vancouver, BC V6C 3B9, and its telephone number is (604) 661-0258.

Listing on the Nasdaq Global Select Market

Our common stock is listed on the Nasdaq Global Select Market under the symbol “INO.”

EMPLOYMENT AGREEMENT

This Employment Agreement (the “Agreement”), dated as of March 8, 2019 is made by and between Inovio Pharmaceuticals, Inc., a Delaware corporation having offices at 660 W. Germantown Pike, Suite 110, Plymouth Meeting, PA 19462 (the “Company”), and Jacqueline E. Shea, Ph.D. (“Executive”).

RECITALS

WHEREAS, the Company desires to employ Executive and to have the benefit of her skills and services, and the Executive desires to accept employment with the Company on the terms and conditions set forth herein; and

WHEREAS, as a condition to her employment by the Company, Executive agrees to execute and shall be bound by the terms and conditions of the Employee Non-Disclosure, Inventions, Non-Competition, and Non-Solicitation Agreement (the “Proprietary Information Agreement”) attached hereto collectively as Exhibit A.

NOW, THEREFORE, in consideration of the mutual promises, terms, covenants and conditions set forth herein and in the Proprietary Information Agreement, and the performance of each, the parties hereto, intending legally to be bound, hereby agree as follows:

1. Employment; Term.

a. The Company hereby agrees to employ Executive as Ex. Vice President, and COO, and Executive hereby agrees to accept such employment with the Company in accordance with the terms and conditions of this Agreement.

b. The “Term” of this Agreement shall commence on the date hereof (the “Commencement Date”) and shall continue in effect until terminated as provided in Section 7 below.

2. Position and Duties.

a. Executive shall serve as Exec VP and COO and shall report to Dr. J. Joseph Kim, Ph.D., or such other executive officer as is designated by the Company or the Board of Directors (the “Board”). Executive shall perform such duties and responsibilities as are normally related to such position, and such other duties as may, from time to time, be assigned to Executive by the Company or the Board. Executive shall perform Executive’s duties from the Company’s office located Plymouth Meeting, PA, and will travel as reasonably necessary to perform Executive’s duties under this Agreement.

b. Executive shall faithfully devote her full business/working time, attention and energy to the business and affairs of the Company and the performance of her duties hereunder and to use reasonable efforts to perform such responsibilities faithfully and efficiently.

c. Without limiting the generality of the foregoing paragraph, during the Term, upon prior written consent of the Chief Executive Officer of the Company, Executive shall be permitted to serve on other Boards of Directors, professional associations and otherwise be involved with any family business or trust to the extent that, in the reasonable judgment of the Chief Executive Officer, such other business pursuits and activity do not materially (i) interfere with Executive's ability to discharge Executive's duties and responsibilities to the Company, whether or not such activity is pursued for gain, profit or other pecuniary advantage, or (ii) cause Executive to violate any provision of the Proprietary Information Agreement or the Confidentiality Agreement.

d. No Guaranty of Employment. This Agreement does not constitute a guarantee of continued employment but instead provides for certain rights and benefits for the Executive during Executive's employment with the Company, and in the event such employment with the Company terminates under circumstances described herein. The employment of Executive shall be "at will" at all times. The Company or Executive may terminate Executive's employment with the Company at any time, without any advance notice (except as provided below), for any reason or no reason at all, notwithstanding anything to the contrary contained in or arising from any statements, policies or practices of the Company relating to the employment, discipline or termination of its employees.

3. Compensation.

a. Executive shall be entitled to receive as compensation for her employment a base annual salary at a rate of \$400,000 per annum (the "Base Salary"), which shall be paid to Executive by the Company or any of its affiliates in accordance with the Company's standard payroll practices, as in effect from time to time.

b. Increases in the Base Salary shall be reviewed annually by the Company's Board of Directors (the "Board") or its Compensation Committee during the Term, and any such increases will be at the Board's or Compensation Committee's sole discretion and will otherwise be consistent with the Company's annual policies and budget for payroll increases.

4. Bonus.

During the Term, Executive shall be eligible to receive an incentive cash bonus up to the amount, based upon the criteria, and payable at such times, as may be determined by the Board or its Compensation Committee. The amount shall be determined by the Board or Compensation Committee, in its sole and absolute discretion, which shall be binding and final, and shall be paid in a one-time lump sum payment (less payroll taxes). To the extent that such cash bonus is to be determined in light of financial performance during a specified fiscal period and the Agreement commences on a date after the start of such fiscal period, any cash bonus payable in respect of such fiscal period's results may be prorated. In addition, if the period of Executive's employment hereunder expires before the end of a fiscal period, and if Executive is eligible to receive a cash bonus at such time (such eligibility being subject to the restrictions set forth in Section 7 below), any cash bonus payable in respect of such fiscal period's results may be prorated. Notwithstanding the foregoing, all bonuses on account a particular year shall be paid on or before March 15th of the following year.

5. Benefits; Stock Options.

In addition to the salary and cash bonus referred to above, Executive shall be entitled during the Term to participate in such employee benefits plans or programs of the Company, and shall be entitled to such other fringe benefits, as are from time to time adopted by the Board and made available by the Company generally to employees of Executive's position, tenure, salary, and other qualifications. Without limiting the generality of the foregoing, Executive shall be eligible for such awards and benefits, if any, under the Company's employee benefits plans or programs as shall be granted to Executive in the sole discretion of the Board or its Compensation Committee and as shall be provided pursuant to the terms of the plans or programs. Executive acknowledges and agrees that the Company does not guarantee the adoption or continuance of any particular employee benefits plan or program or other fringe benefits during the Term, and participation by Executive in any such plan or program shall be subject to the rules and regulations applicable thereto.

6. Expenses.

The Company will reimburse Executive, in accordance with the practices in effect from time to time for other officers or staff personnel of the Company, for all reasonable and necessary business and traveling expenses and other disbursements incurred by Executive for or on behalf of the Company in the performance of Executive's duties hereunder, upon presentation by Executive to the Company of appropriate vouchers and supporting documentation. All reimbursements provided under this Agreement shall be made in accordance with the requirements of Section 409A of the Internal Revenue Code ("Section 409A"), including, where applicable, the requirement that (i) any reimbursement shall be for expenses incurred during Executive's employment, (ii) the amount of expenses eligible for reimbursement, or in-kind benefits provided, during a calendar year may not affect the expenses eligible for reimbursement, or in-kind benefits to be provided, in any other calendar year, (iii) the reimbursement of an eligible expense will be made on or before the last day of the calendar year following the year in which the expense is incurred, and (iv) the right to reimbursement or in-kind benefits is not subject to liquidation or exchange for another benefit.

7. Termination.

Executive's employment by the Company pursuant hereto is subject to termination as follows:

a. Death or Disability. Executive's employment shall be deemed to terminate automatically on the date of Executive's death, and the Company may by written notice to Executive terminate Executive's employment on account of her Total Disability effective as of the date of such notice. For purposes hereof, Executive shall be deemed to experience a "Total Disability" if Executive either: is unable to engage in any substantial gainful activity by reason of any medically determinable physical or mental impairment that can be expected to result in death or can be expected to last for a continuous period of not less than 12 months or is, by reason of any medically determinable physical or mental impairment that can be expected to result in death or can be expected to last for a continuous period of not less than 12 months, receiving income replacement benefits for a period of not less than three months under any group disability or accident and health plan covering Executive. In the event of any dispute under this Section 7(a), Executive shall submit to a physical examination by a licensed physician mutually satisfactory to the Company and Executive, the cost of such examination to be paid by the Company, and the determination of such physician shall be determinative. In the case of a Total Disability, until the Company shall have terminated Executive's employment hereunder in accordance with the foregoing, Executive shall be entitled to receive compensation provided for herein notwithstanding any such Total Disability. In the event of the termination of Executive's employment on

account of her death or Total Disability, neither Executive nor her personal representative will have any rights or claims against the Company under this Agreement except as follows:

(i) Executive (or her estate or representative, as applicable) shall be paid (A) any unpaid portion of her Base Salary computed on a pro rata basis through the date of her termination and (B) any unreimbursed expenses;

(ii) All other of Executive's accrued but unpaid rights shall be as determined under any incentive compensation, stock option, retirement, employee welfare or other employee benefits plan or program of the Company in which Executive is then participating at the time of her termination; and

(iii) in the case of Executive's Total Disability only, (A) the Company shall continue Executive's medical benefits coverage existing at the time of her termination for as long as permissible under the Company's health benefits policies (not to exceed 60 days) and the Company further agrees to pay Executive's COBRA premiums for twelve months thereafter, with such premiums to provide for coverage at the same level and subject to the same terms and conditions (including, without limitation, any applicable co-pay obligations of Executive, but excluding any applicable tax consequences for Executive) as in effect for Executive at the time of termination, and (B) Executive shall further receive a lump-sum payment, within 30 days after the effective date of termination, equal to the aggregate amount of Executive's Base Salary as in effect immediately prior to such termination that would be payable over a period of twelve months following the effective date of such termination.

b. Involuntary Termination for Cause. In the event the Company terminates Executive's employment for Cause (as such term is defined below), such termination shall be effective immediately upon notice thereof, in which case Executive will have no rights or claims against the Company under this Agreement except as follows:

(i) Executive shall be paid (A) any unpaid portion of her Base Salary computed on a pro rata basis through the date of her termination and (B) any unreimbursed expenses; and

(ii) All other of Executive's accrued but unpaid rights shall be as determined under any incentive compensation, stock option, retirement, employee welfare or other employee benefits plan and program of the Company in which Executive is then participating at the time of her termination.

"Cause" shall mean: (1) conviction of Executive of any felony; (2) participation by Executive in any fraud or act of dishonesty against the Company; (3) material violation by Executive of (i) any contract between the Company and Executive, or (ii) any statutory, contractual or common law duty of Executive to the Company; (4) conduct of Executive that, based upon a good faith and reasonable factual investigation and determination by the Board, demonstrates Executive's gross unfitness to serve; or (5) the continued, willful refusal or failure by Executive to follow the instructions of or perform any material duties reasonably requested by the Board or the Chief Executive Officer that are not illegal.

c. Involuntary Termination Without Cause. The Company may terminate Executive's employment, other than on account of death, Total Disability or for Cause, on 30 days' prior written notice, in which case Executive will have no rights or claims against the Company under this Agreement except as follows:

(i) Executive (or her estate or representative, as applicable) shall be paid (A) any unpaid portion of her Base Salary computed on a pro rata basis through the date of her termination, and (B) any unreimbursed expenses;

(ii) All other of Executive's accrued but unpaid rights shall be as determined under any incentive compensation, stock option, retirement, employee welfare or other employee benefits plan and program of the Company in which Executive is then participating at the time of her termination;

(iii) Executive shall receive severance payments in the amount of twelve (12) months' of Executive's Base Salary (as in effect immediately prior to such termination) which will be payable on the date specified in Section 7(h).

(iv) The Company shall pay Executive's COBRA premiums for twelve (12) months thereafter, with such premiums to provide for coverage at substantially the same level and subject to the same terms and conditions (including, without limitation, any applicable co-pay obligations of Executive, but excluding any applicable tax consequences for Executive) as in effect for Executive at the time of termination, provided that Executive timely elects COBRA continuation coverage.

d. Voluntary Termination For Good Reason. Executive may terminate her employment for good reason ("Termination For Good Reason") by providing 30 days' prior written notice to the Company of a breach constituting Good Reason, which notice shall be provided within 45 days after the initial existence of the breach, and further provided that such breach is not cured in all material respects to the reasonable satisfaction of Executive within 30 days after such notice. In the event of Termination for Good Reason, Executive shall be entitled to receive the payments and other rights provided in Section 7(c) hereof. For purposes of this Agreement, termination for "Good Reason" shall mean voluntary termination by Executive of her employment with the Company based on one of the following events:

(i) the material diminution in Executive's position, title, responsibilities or authority from those in effect at the Commencement Date; provided, however, that a material diminution shall not be deemed to have occurred upon a change of control of the Company solely by virtue of the Company's having been acquired and made part of a larger organization;

(ii) a relocation of Executive's principal executive offices more than fifty miles from its location at the Commencement Date; or

(iii) the breach by the Company of any of its material obligations under this Agreement;

e. Other Voluntary Termination. Executive may otherwise terminate her employment without Good Reason upon 30 days' prior written notice to the Company, in which case Executive (or her estate or representative, as applicable) shall be paid (A) any unpaid portion of her Base Salary on a pro rata basis through the date of the termination, and (B) any unreimbursed expenses.

f. Forfeiture of Rights. In the event that, subsequent to the termination of Executive's employment hereunder, Executive breaches any of the provisions of the Proprietary Information Agreement in any material respect, all payments and benefits to which Executive may otherwise have been entitled to pursuant to this Section 7 hereof shall immediately terminate and be forfeited.

g. Release. Executive shall not be entitled to any compensation under this Section 7 unless Executive executes and delivers to the Company a Separation of Employment Agreement and General Release (the "Release") in form and substance satisfactory to the Company, by which Executive releases the Company from any obligations and liabilities of any type whatsoever, except for the Company's obligation to provide the compensation and benefits specified in this Section 7. The parties hereto acknowledge that the payments to be provided under this Section 7 are to be provided in consideration for the Release.

(i) Executive shall execute and return the Release to the Company within the maximum period of time specified within the Release for its execution and return; provided, however, in no event shall that date be more than sixty (60) days following Executive's termination of employment. If the Executive fails to return an executed Release within the earlier of the foregoing dates, the Executive shall forfeit all amounts that would have been payable to her pursuant to this Section 7 whose payment was contingent upon execution of a Release of claims.

(ii) If the Executive executes and returns the Release to the Company within the foregoing periods, then the amounts described in this Section 7 that would be payable to Executive in a single sum shall be payable to executive on the seventy-fourth (74th) day following her termination of employment.

8. Remedies.

In addition to other remedies provided by law or equity, upon a breach by Executive of any of the covenants contained herein or in the Proprietary Information Agreement, the Company shall be entitled to have a court of competent jurisdiction enter an injunction against Executive enjoining Executive and prohibiting any further breach of the covenants contained herein. Executive acknowledges that a breach or threatened breach by Executive of the provisions of this Agreement will cause irreparable damage to the Company because Executive's services to be performed hereunder are of a unique, special and extraordinary character. Thus, the Company shall be entitled to injunctive relief without the necessity of proving actual damages and the Company shall not be required to post a bond or other security in support of such injunctive relief.

9. Arbitration.

Any claim, dispute or controversy arising out of or in connection with Executive's employment by the Company, her separation from the Company, this Agreement, or any breach thereof, shall be arbitrated by the parties before a sole neutral arbitrator (who shall be a retired superior court judge)

conducted by the AAA or any other nationally or locally recognized alternative dispute resolution organization in accordance with the Arbitration Rules and Mediator Procedures of the American Arbitration Association then in effect. A copy of these rules may be obtained from the AAA website, <https://www.adr.org/sites/default/files/Employment%20Rules.pdf>. The claims subject to mandatory arbitration under the terms of this agreement include, but are not limited to, claims that have been or could be asserted under: (a) any law, statute, or constitution, or based on contract, or in tort, or based on common law; and (b) any and all Claims based on or arising under any civil rights laws, labor laws and/or employment laws including, but not limited to, the civil rights laws, labor laws and/or employment laws of any state, municipality or jurisdiction, including, but not limited to, Title VII of the Civil Rights act of 1964, the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA), the Age Discrimination in Employment Act, including the Older Workers Benefit Protection Act, the Employee Retirement Income Security Act, 42 U.S.C. § 1981, the Fair Labor Standards Act, the Americans with Disabilities Act, the Civil Rights Act of 1991, the Family and Medical Leave Act, the California Fair Employment and Housing Act, the California Family Rights Act, the California Labor Code, or California Constitution; (c) any other federal, state or local law, constitution, regulation, ordinance, decision or common law claim concerning employment discrimination or termination of employment; (d) any and all claims for personal injury, emotional distress, libel, slander, defamation, and other physical, economic, or emotional injury; and (e) all claims for attorney's fees and costs.

The arbitrator shall have the authority to order discovery sufficient for both parties to adequately arbitrate any and all claim(s) and defense(s) at issue. Such discovery shall include access to relevant documents and witnesses, but shall not have the authority to add to, detract from or modify any provision hereof nor to award damages or other remedies not otherwise available under statute(s), contract(s) or common law relevant to the claim(s) and defense(s) at issue. Following the close of all evidence at the conclusion of the arbitration hearing, the neutral arbitrator shall issue a written award that reveals his or her essential findings and conclusions. The neutral arbitrator's decision shall be final and binding. Judgment may be entered on the arbitrator's award in any court having jurisdiction. The direct expense of any arbitration proceeding shall be borne by the Company. Each party shall bear its own attorney's fees and costs unless such fees are awarded as a measure of damages under the applicable contract or statute at issue. Such arbitration shall take place in San Diego, California at a location and date mutually agreeable to the parties. The parties hereto consent to the jurisdiction of the state and federal courts located in the State of California with respect to any action arising under this Agreement. Notwithstanding the foregoing, the Company shall be entitled to seek injunctive or other equitable relief, as contemplated by Section 8 hereof, from any court of competent jurisdiction, without the need to resort to arbitration.

10. Assignment; Binding Nature.

This Agreement shall be binding upon and inure to the benefit of the parties and their respective successors, heirs (in the case of Executive) and permitted assigns. No rights or obligations of the Company under this Agreement may be assigned or transferred by the Company except that such rights or obligations may be assigned or transferred to the successor of the Company or its business if the assignee or transferee assumes all of the liabilities, obligations and duties of the Company, as contained in this Agreement, either contractually or as a matter of law. If any such successor of the Company or its business does not agree to so assume such liabilities, obligations and duties, Executive may immediately resign, which shall be deemed a Termination For Good Reason under the provisions of this Agreement.

No rights or obligations of Executive under this Agreement may be assigned or transferred by Executive other than Executive's rights to compensation and benefits, which may be transferred only by will or operation of law, except as otherwise specifically provided or permitted hereunder.

11. Notice.

Any notice which a party is required or may desire to give pursuant to this Agreement shall be given in writing by personal delivery, by registered or certified mail, return receipt requested, postage prepaid, or by overnight courier, at the following addresses:

If to the Company:

Inovio Pharmaceuticals, Inc.
1787 Sentry Parkway West
Building 18, Suite 400
Blue Bell, PA 19422
Attention: Chief Executive Officer

If to Executive:

Jacqueline E. Shea Ph.D.

Any notice personally delivered shall be deemed received when given, or if given by overnight courier shall be deemed received on the next business day and any notice mailed shall be deemed received on the third business day thereafter.

12. Entire Agreement.

This Agreement and the Proprietary Information Agreement (Exhibit A) constitute the complete agreements and understandings between the Company and Executive concerning Executive's employment by the Company, and supersede any and all previous agreements or understandings concerning such employment, whether written or oral, between Executive and the Company.

13. Modification.

This Agreement may only be amended or superseded by a written document signed by Executive and by the CEO of the Company.

14. Waiver.

Except as set forth herein, no delay or omission to exercise any right, power or remedy accruing to any party shall impair any such right, power or remedy or shall be construed to be a waiver of or an acquiescence to any breach hereof. No waiver by either party of any breach by the other party of any condition or provision contained in this Agreement to be performed by such other party shall be deemed a waiver of a similar or dissimilar condition or provision at the same or any prior or subsequent time. Any waiver must be in writing and signed by Executive and the Chief Executive Officer or other duly authorized officer of the Company.

15. Section 409A.

All amounts payable under this Agreement are intended to comply with the “short term deferral” exception from Section 409A specified in Treas. Reg. § 1.409A-1(b)(4) (or any successor provision) or the “separation pay plan” exception specified in Treas. Reg. § 1.409A-1(b)(9) (or any successor provision), or both of them, and shall be interpreted in a manner consistent with the applicable exceptions. Notwithstanding the foregoing, to the extent that any amounts payable in accordance with this Agreement are subject to Section 409A, this Agreement shall be interpreted and administered in such a way as to comply with Section 409A to the maximum extent possible. Each installment payment of compensation under this Agreement shall be treated as a separate payment of compensation for purposes of applying Section 409A. The severance amounts described in this Agreement shall be paid only upon the occurrence of an involuntary “separation from service,” as defined in Section 409A. If payment of any amount subject to Section 409A is triggered by a separation from service that occurs while the Employee is a “specified employee” (as defined by Section 409A), and if such amount is scheduled to be paid within six (6) months after such separation from service, the amount shall accrue without interest and shall be paid the first business day after the end of such six-month period, or, if earlier, within 15 days after the appointment of the personal representative or executor of the Employee’s estate following the Employee’s death. “Termination of employment,” “resignation” or words of similar import, as used in this Agreement shall mean, with respect to any payments subject to Section 409A, the Employee’s “separation from service” as defined by Section 409A. If any payment subject to Section 409A is contingent on the delivery of a release by Employee and could occur in either of two years, the payment will occur in the later year. Nothing in this Agreement or the Plan shall be construed as a guarantee of any particular tax treatment to the Employee. The Employee shall be solely responsible for the tax consequences with respect to all amounts payable under this Agreement, and in no event shall the Company have any responsibility or liability if this Agreement does not meet any applicable requirements of Code section 409A.

In addition, to the extent that any Internal Revenue Service guidance issued under Section 409A would result in Executive being subject to the payment of interest or any additional tax under Section 409A, the parties agree, to the extent reasonably possible, to amend this Agreement in order to avoid the imposition of any such interest or additional tax under Section 409A, which amendment shall have the minimum economic effect necessary to the Executive and shall not result in any additional cost to the Company, unless it agrees otherwise to incur such cost, and shall be reasonably determined in good faith by the Company and Executive.

16. Invalidity of Any Provision.

If any portion of this Agreement is held invalid or inoperative, the other portions of this Agreement shall be deemed valid and operative and, so far as is reasonable and permitted by the law, effect shall be given to the intent manifested by the portion held invalid or inoperative.

17. Applicable Law.

This Agreement shall be governed by and construed in accordance with the laws of the State of California, without regard to the principles of conflict of laws thereof.

18. Counterparts.

This Agreement may be executed simultaneously in any number of counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same agreement.

19. Headings.

The Section headings contained in this Agreement are for reference purposes only and will not affect in any way the meaning or interpretation of this Agreement.

20. Binding Effect.

The provisions of this Agreement will be binding upon, and will inure to the benefit of, the respective heirs, legal representatives and successors of the parties thereto.

[SIGNATURES ON FOLLOWING PAGE]

IN WITNESS WHEREOF, the parties hereto have executed this Employment Agreement as of the date first written above.

EMPLOYMENT AGREEMENT

This Employment Agreement (the "Agreement"), dated as of March 4, 2019 is made by and between Inovio Pharmaceuticals, Inc., a Delaware corporation having offices at 660 W. Germantown Pike, Suite 110, Plymouth Meeting, PA 19462 (the "Company"), and Laurent Michel Paul Francois Humeau, Ph.D.(Executive).

RECITALS

WHEREAS, the Company and Executive entered into an Employment Agreement dated December 1, 2017 ("Prior Agreement") and the Company desires to amend the Executive's title to be Chief Scientific Officer and Executive Vice President and to have the benefit of his skills and services, and the Executive desires to accept employment with the Company on the terms and conditions set for herein; and

WHEREAS, as a condition to his employment by the Company, Executive agrees to execute and shall be bound by the terms and conditions of the Employee Non-Disclosure, Inventions, Non-Competition, and Non-Solicitation Agreement and the California Addendum (the "Proprietary Information Agreement") attached hereto collectively as Exhibit A.

NOW, THEREFORE, in consideration of the mutual promises, terms, covenants and conditions set forth herein and in the Proprietary Information Agreement, and the performance of each, the parties hereto, intending legally to be bound, hereby agree as follows:

1. Employment; Term.

a. The Company hereby agrees to employ Executive as Chief Scientific Officer & Executive Vice President and Executive hereby agrees to accept such employment with the Company in accordance with the terms and conditions of this Agreement.

b. The "Term" of this Agreement shall commence on the date hereof March 4, 2019 and shall continue in effect until terminated as provided in Section 7 below.

2. Position and Duties.

a. Executive shall serve as Chief Scientific Officer and Executive Vice President and shall report to Dr. J. Joseph Kim, Ph.D., or such other executive officer as is designated by the Company or the Board of Directors (the "Board"). Executive shall perform such duties and responsibilities as are normally related to such position, and such other duties as may, from time to time, be assigned to Executive by the Company or the Board. Executive shall perform Executive's duties from the Company's office located San Diego, California, and will travel as reasonably necessary to perform Executive's duties under this Agreement.

b. Executive shall faithfully devote his full business/working time, attention and energy to the business and affairs of the Company and the performance of his duties hereunder and to use reasonable efforts to perform such responsibilities faithfully and efficiently.

c. Without limiting the generality of the foregoing paragraph, during the Term, upon prior written consent of the Chief Executive Officer of the Company, Executive shall be permitted to serve on other Boards of Directors, professional associations and otherwise be involved with any family business or trust to the extent that, in the reasonable judgment of the Chief Executive Officer, such other business pursuits and activity do not materially (i) interfere with Executive's ability to discharge Executive's duties and responsibilities to the Company, whether or not such activity is pursued for gain, profit or other pecuniary advantage, or (ii) cause Executive to violate any provision of the Proprietary Information Agreement or the Confidentiality Agreement.

d. No Guaranty of Employment. This Agreement does not constitute a guarantee of continued employment but instead provides for certain rights and benefits for the Executive during Executive's employment with the Company, and in the event such employment with the Company terminates under circumstances described herein. The employment of Executive shall be "at will" at all times. The Company or Executive may terminate Executive's employment with the Company at any time, without any advance notice (except as provided below), for any reason or no reason at all, notwithstanding anything to the contrary contained in or arising from any statements, policies or practices of the Company relating to the employment, discipline or termination of its employees.

3. Compensation.

a. Executive shall be entitled to receive as compensation for his employment a base annual salary at a rate of \$400,000.00 per annum (the "Base Salary"), which shall be paid to Executive by the Company or any of its affiliates in accordance with the Company's standard payroll practices, as in effect from time to time.

b. Increases in the Base Salary shall be reviewed annually by the Company's Board of Directors (the "Board") or it's Compensation Committee during the Term, and any such increases will be at the Board's or Compensation Committee's sole discretion and will otherwise be consistent with the Company's annual policies and budget for payroll increases.

4. Bonus.

During the Term, Executive shall be eligible to receive an incentive cash bonus up to the amount, based upon the criteria, and payable at such times, as may be determined by the Board or its Compensation Committee. The amount shall be determined by the Board or Compensation Committee, in its sole and absolute discretion, which shall be binding and final, and shall be paid in a one-time lump sum payment (less payroll taxes). To the extent that such cash bonus is to be determined in light of financial performance during a specified fiscal period and the Agreement commences on a date after the start of such fiscal period, any cash bonus payable in respect of such fiscal period's results may be prorated. In addition, if the period of Executive's employment hereunder expires before the end of a fiscal period, and if Executive is eligible to receive a cash bonus at such time (such eligibility being subject to the restrictions set forth in Section 7 below), any cash bonus payable in respect of such fiscal period's results may be prorated. Notwithstanding the foregoing, all bonuses on account a particular year shall be paid on or before March 15th of the following year.

5. Benefits; Stock Options.

In addition to the salary and cash bonus referred to above, Executive shall be entitled during the Term to participate in such employee benefits plans or programs of the Company, and shall be entitled to such other fringe benefits, as are from time to time adopted by the Board and made available by the Company generally to employees of Executive's position, tenure, salary, and other qualifications. Without limiting the generality of the foregoing, Executive shall be eligible for such awards and benefits, if any, under the Company's employee benefits plans or programs as shall be granted to Executive in the sole discretion of the Board or its Compensation Committee and as shall be provided pursuant to the terms of the plans or programs. Executive acknowledges and agrees that the Company does not guarantee the adoption or continuance of any particular employee benefits plan or program or other fringe benefits during the Term, and participation by Executive in any such plan or program shall be subject to the rules and regulations applicable thereto.

6. Expenses.

The Company will reimburse Executive, in accordance with the practices in effect from time to time for other officers or staff personnel of the Company, for all reasonable and necessary business and traveling expenses and other disbursements incurred by Executive for or on behalf of the Company in the performance of Executive's duties hereunder, upon presentation by Executive to the Company of appropriate vouchers and supporting documentation. All reimbursements provided under this Agreement shall be made in accordance with the requirements of Section 409A of the Internal Revenue Code ("Section 409A"), including, where applicable, the requirement that (i) any reimbursement shall be for expenses incurred during Executive's employment, (ii) the amount of expenses eligible for reimbursement, or in-kind benefits provided, during a calendar year may not affect the expenses eligible for reimbursement, or in-kind benefits to be provided, in any other calendar year, (iii) the reimbursement of an eligible expense will be made on or before the last day of the calendar year following the year in which the expense is incurred, and (iv) the right to reimbursement or in-kind benefits is not subject to liquidation or exchange for another benefit.

7. Termination.

Executive's employment by the Company pursuant hereto is subject to termination as follows:

a. Death or Disability. Executive's employment shall be deemed to terminate automatically on the date of Executive's death, and the Company may by written notice to Executive terminate Executive's employment on account of his Total Disability effective as of the date of such notice. For purposes hereof, Executive shall be deemed to experience a "Total Disability" if Executive either: is unable to engage in any substantial gainful activity by reason of any medically determinable physical or mental impairment that can be expected to result in death or can be expected to last for a continuous period of not less than 12 months or is, by reason of any medically determinable physical or mental impairment that can be expected to result in death or can be expected to last for a continuous period of not less than 12 months, receiving income replacement benefits for a period of not less than three months under any group disability or accident and health plan covering Executive. In the event of any dispute under this Section 7(a), Executive shall submit to a physical examination by a licensed physician mutually satisfactory to the Company and Executive, the cost of such examination to be paid by the Company, and the determination of such physician shall be determinative. In the case of a Total Disability, until the Company shall have terminated Executive's employment hereunder in accordance with the foregoing, Executive shall be entitled to receive compensation provided for herein notwithstanding any such Total Disability. In the event of the termination of Executive's employment on

account of his death or Total Disability, neither Executive nor his personal representative will have any rights or claims against the Company under this Agreement except as follows:

(i) Executive (or his estate or representative, as applicable) shall be paid (A) any unpaid portion of his Base Salary computed on a pro rata basis through the date of his termination and (B) any unreimbursed expenses;

(ii) All other of Executive's accrued but unpaid rights shall be as determined under any incentive compensation, stock option, retirement, employee welfare or other employee benefits plan or program of the Company in which Executive is then participating at the time of his termination; and

(iii) in the case of Executive's Total Disability only, (A) the Company shall continue Executive's medical benefits coverage existing at the time of his termination for as long as permissible under the Company's health benefits policies (not to exceed 60 days) and the Company further agrees to pay Executive's COBRA premiums for twelve months thereafter, with such premiums to provide for coverage at the same level and subject to the same terms and conditions (including, without limitation, any applicable co-pay obligations of Executive, but excluding any applicable tax consequences for Executive) as in effect for Executive at the time of termination, and (B) Executive shall further receive a lump-sum payment, within 30 days after the effective date of termination, equal to the aggregate amount of Executive's Base Salary as in effect immediately prior to such termination that would be payable over a period of twelve months following the effective date of such termination.

b. Involuntary Termination for Cause. In the event the Company terminates Executive's employment for Cause (as such term is defined below), such termination shall be effective immediately upon notice thereof, in which case Executive will have no rights or claims against the Company under this Agreement except as follows:

(i) Executive shall be paid (A) any unpaid portion of his Base Salary computed on a pro rata basis through the date of his termination and (B) any unreimbursed expenses; and

(ii) All other of Executive's accrued but unpaid rights shall be as determined under any incentive compensation, stock option, retirement, employee welfare or other employee benefits plan and program of the Company in which Executive is then participating at the time of his termination.

"Cause" shall mean: (1) conviction of Executive of any felony; (2) participation by Executive in any fraud or act of dishonesty against the Company; (3) material violation by Executive of (i) any contract between the Company and Executive, or (ii) any statutory, contractual or common law duty of Executive to the Company; (4) conduct of Executive that, based upon a good faith and reasonable factual investigation and determination by the Board, demonstrates Executive's gross unfitness to serve; or (5) the continued, willful refusal or failure by Executive to follow the instructions of or perform any material duties reasonably requested by the Board or the Chief Executive Officer that are not illegal.

c. Involuntary Termination Without Cause. The Company may terminate Executive's employment, other than on account of death, Total Disability or for Cause, on 30 days' prior written notice, in which case Executive will have no rights or claims against the Company under this Agreement except as follows:

(i) Executive (or his estate or representative, as applicable) shall be paid (A) any unpaid portion of his Base Salary computed on a pro rata basis through the date of his termination, and (B) any unreimbursed expenses;

(ii) All other of Executive's accrued but unpaid rights shall be as determined under any incentive compensation, stock option, retirement, employee welfare or other employee benefits plan and program of the Company in which Executive is then participating at the time of his termination;

(iii) Executive shall receive severance payments in the amount of twelve (12) months' of Executive's Base Salary (as in effect immediately prior to such termination) which will be payable on the date specified in Section 7(h).

(iv) The Company shall pay Executive's COBRA premiums for twelve (12) months thereafter, with such premiums to provide for coverage at substantially the same level and subject to the same terms and conditions (including, without limitation, any applicable co-pay obligations of Executive, but excluding any applicable tax consequences for Executive) as in effect for Executive at the time of termination, provided that Executive timely elects COBRA continuation coverage.

d. Voluntary Termination For Good Reason. Executive may terminate his employment for good reason ("Termination For Good Reason") by providing 30 days' prior written notice to the Company of a breach constituting Good Reason, which notice shall be provided within 45 days after the initial existence of the breach, and further provided that such breach is not cured in all material respects to the reasonable satisfaction of Executive within 30 days after such notice. In the event of Termination for Good Reason, Executive shall be entitled to receive the payments and other rights provided in Section 7(c) hereof. For purposes of this Agreement, termination for "Good Reason" shall mean voluntary termination by Executive of his employment with the Company based on one of the following events:

(i) the material diminution in Executive's position, title, responsibilities or authority from those in effect at the Commencement Date; provided, however, that a material diminution shall not be deemed to have occurred upon a change of control of the Company solely by virtue of the Company's having been acquired and made part of a larger organization;

(ii) a relocation of Executive's principal executive offices more than fifty miles from its location at the Commencement Date; or

(iii) the breach by the Company of any of its material obligations under this Agreement;

e. Other Voluntary Termination. Executive may otherwise terminate his employment without Good Reason upon 30 days' prior written notice to the Company, in which case Executive (or his estate or representative, as applicable) shall be paid (A) any unpaid portion of his Base Salary on a pro rata basis through the date of the termination, and (B) any unreimbursed expenses.

f. Forfeiture of Rights. In the event that, subsequent to the termination of Executive's employment hereunder, Executive breaches any of the provisions of the Proprietary Information Agreement in any material respect, all payments and benefits to which Executive may otherwise have been entitled to pursuant to this Section 7 hereof shall immediately terminate and be forfeited.

g. Release. Executive shall not be entitled to any compensation under this Section 7 unless Executive executes and delivers to the Company a Separation of Employment Agreement and General Release (the "Release") in form and substance satisfactory to the Company, by which Executive releases the Company from any obligations and liabilities of any type whatsoever, except for the Company's obligation to provide the compensation and benefits specified in this Section 7. The parties hereto acknowledge that the payments to be provided under this Section 7 are to be provided in consideration for the Release.

(i) Executive shall execute and return the Release to the Company within the maximum period of time specified within the Release for its execution and return; provided, however, in no event shall that date be more than sixty (60) days following Executive's termination of employment. If the Executive fails to return an executed Release within the earlier of the foregoing dates, the Executive shall forfeit all amounts that would have been payable to his pursuant to this Section 7 whose payment was contingent upon execution of a Release of claims.

(ii) If the Executive executes and returns the Release to the Company within the foregoing periods, then the amounts described in this Section 7 that would be payable to Executive in a single sum shall be payable to executive on the seventy-fourth (74th) day following his termination of employment.

8. Remedies.

In addition to other remedies provided by law or equity, upon a breach by Executive of any of the covenants contained herein or in the Proprietary Information Agreement, the Company shall be entitled to have a court of competent jurisdiction enter an injunction against Executive enjoining Executive and prohibiting any further breach of the covenants contained herein. Executive acknowledges that a breach or threatened breach by Executive of the provisions of this Agreement will cause irreparable damage to the Company because Executive's services to be performed hereunder are of a unique, special and extraordinary character. Thus, the Company shall be entitled to injunctive relief without the necessity of proving actual damages and the Company shall not be required to post a bond or other security in support of such injunctive relief.

9. Arbitration.

Any claim, dispute or controversy arising out of or in connection with Executive's employment by the Company, his separation from the Company, this Agreement, or any breach thereof, shall be arbitrated by the parties before a sole neutral arbitrator (who shall be a retired superior court judge)

conducted by the AAA or any other nationally or locally recognized alternative dispute resolution organization in accordance with the Arbitration Rules and Mediator Procedures of the American Arbitration Association then in effect. A copy of these rules may be obtained from the AAA website, <https://www.adr.org/sites/default/files/Employment%20Rules.pdf>. The claims subject to mandatory arbitration under the terms of this agreement include, but are not limited to, claims that have been or could be asserted under: (a) any law, statute, or constitution, or based on contract, or in tort, or based on common law; and (b) any and all Claims based on or arising under any civil rights laws, labor laws and/or employment laws including, but not limited to, the civil rights laws, labor laws and/or employment laws of any state, municipality or jurisdiction, including, but not limited to, Title VII of the Civil Rights act of 1964, the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA), the Age Discrimination in Employment Act, including the Older Workers Benefit Protection Act, the Employee Retirement Income Security Act, 42 U.S.C. § 1981, the Fair Labor Standards Act, the Americans with Disabilities Act, the Civil Rights Act of 1991, the Family and Medical Leave Act, the California Fair Employment and Housing Act, the California Family Rights Act, the California Labor Code, or California Constitution; (c) any other federal, state or local law, constitution, regulation, ordinance, decision or common law claim concerning employment discrimination or termination of employment; (d) any and all claims for personal injury, emotional distress, libel, slander, defamation, and other physical, economic, or emotional injury; and (e) all claims for attorney's fees and costs.

The arbitrator shall have the authority to order discovery sufficient for both parties to adequately arbitrate any and all claim(s) and defense(s) at issue. Such discovery shall include access to relevant documents and witnesses, but shall not have the authority to add to, detract from or modify any provision hereof nor to award damages or other remedies not otherwise available under statute(s), contract(s) or common law relevant to the claim(s) and defense(s) at issue. Following the close of all evidence at the conclusion of the arbitration hearing, the neutral arbitrator shall issue a written award that reveals his or his essential findings and conclusions. The neutral arbitrator's decision shall be final and binding. Judgment may be entered on the arbitrator's award in any court having jurisdiction. The direct expense of any arbitration proceeding shall be borne by the Company. Each party shall bear its own attorney's fees and costs unless such fees are awarded as a measure of damages under the applicable contract or statute at issue. Such arbitration shall take place in San Diego, California at a location and date mutually agreeable to the parties. The parties hereto consent to the jurisdiction of the state and federal courts located in the State of California with respect to any action arising under this Agreement. Notwithstanding the foregoing, the Company shall be entitled to seek injunctive or other equitable relief, as contemplated by Section 8 hereof, from any court of competent jurisdiction, without the need to resort to arbitration.

10. Assignment; Binding Nature.

This Agreement shall be binding upon and inure to the benefit of the parties and their respective successors, heirs (in the case of Executive) and permitted assigns. No rights or obligations of the Company under this Agreement may be assigned or transferred by the Company except that such rights or obligations may be assigned or transferred to the successor of the Company or its business if the assignee or transferee assumes all of the liabilities, obligations and duties of the Company, as contained in this Agreement, either contractually or as a matter of law. If any such successor of the Company or its business does not agree to so assume such liabilities, obligations and duties, Executive may immediately resign, which shall be deemed a Termination For Good Reason under the provisions of this Agreement.

No rights or obligations of Executive under this Agreement may be assigned or transferred by Executive other than Executive's rights to compensation and benefits, which may be transferred only by will or operation of law, except as otherwise specifically provided or permitted hereunder.

11. Notice.

Any notice which a party is required or may desire to give pursuant to this Agreement shall be given in writing by personal delivery, by registered or certified mail, return receipt requested, postage prepaid, or by overnight courier, at the following addresses:

If to the Company:

Inovio Pharmaceuticals
660 W. Germantown Pike, Suite 110
Plymouth Meeting, PA 19462
Attention: Chief Executive Officer

If to Executive:

Laurent Humeau

Any notice personally delivered shall be deemed received when given, or if given by overnight courier shall be deemed received on the next business day and any notice mailed shall be deemed received on the third business day thereafter.

12. Entire Agreement.

This Agreement and the Proprietary Information Agreement (Exhibit A) constitute the complete agreements and understandings between the Company and Executive concerning Executive's employment by the Company, and supersede any and all previous agreements or understandings concerning such employment, whether written or oral, between Executive and the Company.

13. Modification.

This Agreement may only be amended or superseded by a written document signed by Executive and by the CEO of the Company.

14. Waiver.

Except as set forth herein, no delay or omission to exercise any right, power or remedy accruing to any party shall impair any such right, power or remedy or shall be construed to be a waiver of or an acquiescence to any breach hereof. No waiver by either party of any breach by the other party of any condition or provision contained in this Agreement to be performed by such other party shall be deemed a waiver of a similar or dissimilar condition or provision at the same or any prior or subsequent time. Any waiver must be in writing and signed by Executive and the Chief Executive Officer or other duly authorized officer of the Company.

15. Section 409A.

All amounts payable under this Agreement are intended to comply with the “short term deferral” exception from Section 409A specified in Treas. Reg. § 1.409A-1(b)(4) (or any successor provision) or the “separation pay plan” exception specified in Treas. Reg. § 1.409A-1(b)(9) (or any successor provision), or both of them, and shall be interpreted in a manner consistent with the applicable exceptions. Notwithstanding the foregoing, to the extent that any amounts payable in accordance with this Agreement are subject to Section 409A, this Agreement shall be interpreted and administered in such a way as to comply with Section 409A to the maximum extent possible. Each installment payment of compensation under this Agreement shall be treated as a separate payment of compensation for purposes of applying Section 409A. The severance amounts described in this Agreement shall be paid only upon the occurrence of an involuntary “separation from service,” as defined in Section 409A. If payment of any amount subject to Section 409A is triggered by a separation from service that occurs while the Employee is a “specified employee” (as defined by Section 409A), and if such amount is scheduled to be paid within six (6) months after such separation from service, the amount shall accrue without interest and shall be paid the first business day after the end of such six-month period, or, if earlier, within 15 days after the appointment of the personal representative or executor of the Employee’s estate following the Employee’s death. “Termination of employment,” “resignation” or words of similar import, as used in this Agreement shall mean, with respect to any payments subject to Section 409A, the Employee’s “separation from service” as defined by Section 409A. If any payment subject to Section 409A is contingent on the delivery of a release by Employee and could occur in either of two years, the payment will occur in the later year. Nothing in this Agreement or the Plan shall be construed as a guarantee of any particular tax treatment to the Employee. The Employee shall be solely responsible for the tax consequences with respect to all amounts payable under this Agreement, and in no event shall the Company have any responsibility or liability if this Agreement does not meet any applicable requirements of Code section 409A.

In addition, to the extent that any Internal Revenue Service guidance issued under Section 409A would result in Executive being subject to the payment of interest or any additional tax under Section 409A, the parties agree, to the extent reasonably possible, to amend this Agreement in order to avoid the imposition of any such interest or additional tax under Section 409A, which amendment shall have the minimum economic effect necessary to the Executive and shall not result in any additional cost to the Company, unless it agrees otherwise to incur such cost, and shall be reasonably determined in good faith by the Company and Executive.

16. Invalidity of Any Provision.

If any portion of this Agreement is held invalid or inoperative, the other portions of this Agreement shall be deemed valid and operative and, so far as is reasonable and permitted by the law, effect shall be given to the intent manifested by the portion held invalid or inoperative.

17. Applicable Law.

This Agreement shall be governed by and construed in accordance with the laws of the State of California, without regard to the principles of conflict of laws thereof.

18. Counterparts.

This Agreement may be executed simultaneously in any number of counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same agreement.

19. Headings.

The Section headings contained in this Agreement are for reference purposes only and will not affect in any way the meaning or interpretation of this Agreement.

20. Binding Effect.

The provisions of this Agreement will be binding upon, and will inure to the benefit of, the respective heirs, legal representatives and successors of the parties thereto.

[SIGNATURES ON FOLLOWING PAGE]

IN WITNESS WHEREOF, the parties hereto have executed this Employment Agreement as of the date first written above.

**Certification of CEO Pursuant to
Securities Exchange Act Rules 13a-15(e) and 15d-15(e)
as Adopted Pursuant to
Section 302 of the Sarbanes-Oxley Act of 2002**

I, J. Joseph Kim, certify that:

1. I have reviewed this annual report on Form 10-K of Inovio Pharmaceuticals, Inc.
2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;
3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;
4. The registrant's other certifying officer(s) and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)) and internal control over financial reporting (as defined in Exchange Act Rules 13a-15(f) and 15(d)-15(f)) for the registrant and have:
 - (a) Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;
 - (b) Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;
 - (c) Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and
 - (d) Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter (the registrant's fourth fiscal quarter in the case of an annual report) that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and
5. The registrant's other certifying officer(s) and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):
 - (a) All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and
 - (b) Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting.
